
Welcome to E-XFL.COM

Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Details	
Product Status	Active
Number of LABs/CLBs	-
Number of Logic Elements/Cells	13824
Total RAM Bits	110592
Number of I/O	97
Number of Gates	600000
Voltage - Supply	1.14V ~ 1.575V
Mounting Type	Surface Mount
Operating Temperature	0°C ~ 70°C (TA)
Package / Case	144-LBGA
Supplier Device Package	144-FPBGA (13x13)
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/agl600v2-fg144

Flash Advantages

Low Power

Flash-based IGLOO devices exhibit power characteristics similar to those of an ASIC, making them an ideal choice for power-sensitive applications. IGLOO devices have only a very limited power-on current surge and no high-current transition period, both of which occur on many FPGAs.

IGLOO devices also have low dynamic power consumption to further maximize power savings; power is even further reduced by the use of a 1.2 V core voltage.

Low dynamic power consumption, combined with low static power consumption and Flash*Freeze technology, gives the IGLOO device the lowest total system power offered by any FPGA.

Security

Nonvolatile, flash-based IGLOO devices do not require a boot PROM, so there is no vulnerable external bitstream that can be easily copied. IGLOO devices incorporate FlashLock, which provides a unique combination of reprogrammability and design security without external overhead, advantages that only an FPGA with nonvolatile flash programming can offer.

IGLOO devices utilize a 128-bit flash-based lock and a separate AES key to provide the highest level of protection in the FPGA industry for intellectual property and configuration data. In addition, all FlashROM data in IGLOO devices can be encrypted prior to loading, using the industry-leading AES-128 (FIPS192) bit block cipher encryption standard. AES was adopted by the National Institute of Standards and Technology (NIST) in 2000 and replaces the 1977 DES standard. IGLOO devices have a built-in AES decryption engine and a flash-based AES key that make them the most comprehensive programmable logic device security solution available today. IGLOO devices with AES-based security provide a high level of protection for remote field updates over public networks such as the Internet, and are designed to ensure that valuable IP remains out of the hands of system overbuilders, system cloners, and IP thieves.

Security, built into the FPGA fabric, is an inherent component of the IGLOO family. The flash cells are located beneath seven metal layers, and many device design and layout techniques have been used to make invasive attacks extremely difficult. The IGLOO family, with FlashLock and AES security, is unique in being highly resistant to both invasive and noninvasive attacks. Your valuable IP is protected with industry-standard security, making remote ISP possible. An IGLOO device provides the best available security for programmable logic designs.

Single Chip

Flash-based FPGAs store their configuration information in on-chip flash cells. Once programmed, the configuration data is an inherent part of the FPGA structure, and no external configuration data needs to be loaded at system power-up (unlike SRAM-based FPGAs). Therefore, flash-based IGLOO FPGAs do not require system configuration components such as EEPROMs or microcontrollers to load device configuration data. This reduces bill-of-materials costs and PCB area, and increases security and system reliability.

Instant On

Flash-based IGLOO devices support Level 0 of the Instant On classification standard. This feature helps in system component initialization, execution of critical tasks before the processor wakes up, setup and configuration of memory blocks, clock generation, and bus activity management. The Instant On feature of flash-based IGLOO devices greatly simplifies total system design and reduces total system cost, often eliminating the need for CPLDs and clock generation PLLs. In addition, glitches and brownouts in system power will not corrupt the IGLOO device's flash configuration, and unlike SRAM-based FPGAs, the device will not have to be reloaded when system power is restored. This enables the reduction or complete removal of the configuration PROM, expensive voltage monitor, brownout detection, and clock generator devices from the PCB design. Flash-based IGLOO devices simplify total system design and reduce cost and design risk while increasing system reliability and improving system initialization time.

IGLOO flash FPGAs allow the user to quickly enter and exit Flash*Freeze mode. This is done almost instantly (within 1 µs) and the device retains configuration and data in registers and RAM. Unlike SRAM-based FPGAs the device does not need to reload configuration and design state from external memory components; instead it retains all necessary information to resume operation immediately.

Reduced Cost of Ownership

Advantages to the designer extend beyond low unit cost, performance, and ease of use. Unlike SRAM-based FPGAs, Flash-based IGLOO devices allow all functionality to be Instant On; no external boot PROM is required. On-board security mechanisms prevent access to all the programming information and enable secure remote updates of the FPGA logic. Designers can perform secure remote in-system reprogramming to support future design iterations and

User Nonvolatile FlashROM

IGLOO devices have 1 kbit of on-chip, user-accessible, nonvolatile FlashROM. The FlashROM can be used in diverse system applications:

- Internet protocol addressing (wireless or fixed)
- System calibration settings
- Device serialization and/or inventory control
- Subscription-based business models (for example, set-top boxes)
- Secure key storage for secure communications algorithms
- Asset management/tracking
- Date stamping
- Version management

The FlashROM is written using the standard IGLOO IEEE 1532 JTAG programming interface. The core can be individually programmed (erased and written), and on-chip AES decryption can be used selectively to securely load data over public networks (except in the AGL015 and AGL030 devices), as in security keys stored in the FlashROM for a user design.

The FlashROM can be programmed via the JTAG programming interface, and its contents can be read back either through the JTAG programming interface or via direct FPGA core addressing. Note that the FlashROM can only be programmed from the JTAG interface and cannot be programmed from the internal logic array.

The FlashROM is programmed as 8 banks of 128 bits; however, reading is performed on a byte-by-byte basis using a synchronous interface. A 7-bit address from the FPGA core defines which of the 8 banks and which of the 16 bytes within that bank are being read. The three most significant bits (MSBs) of the FlashROM address determine the bank, and the four least significant bits (LSBs) of the FlashROM address define the byte.

The Microsemi development software solutions, Libero® System-on-Chip (SoC) and Designer, have extensive support for the FlashROM. One such feature is auto-generation of sequential programming files for applications requiring a unique serial number in each part. Another feature allows the inclusion of static data for system version control. Data for the FlashROM can be generated quickly and easily using Libero SoC and Designer software tools. Comprehensive programming file support is also included to allow for easy programming of large numbers of parts with differing FlashROM contents.

SRAM and FIFO

IGLOO devices (except the AGL015 and AGL030 devices) have embedded SRAM blocks along their north and south sides. Each variable-aspect-ratio SRAM block is 4,608 bits in size. Available memory configurations are 256×18, 512×9, 1k×4, 2k×2, and 4k×1 bits. The individual blocks have independent read and write ports that can be configured with different bit widths on each port. For example, data can be sent through a 4-bit port and read as a single bitstream. The embedded SRAM blocks can be initialized via the device JTAG port (ROM emulation mode) using the UJTAG macro (except in the AGL015 and AGL030 devices).

In addition, every SRAM block has an embedded FIFO control unit. The control unit allows the SRAM block to be configured as a synchronous FIFO without using additional core VersaTiles. The FIFO width and depth are programmable. The FIFO also features programmable Almost Empty (AEMPTY) and Almost Full (AFULL) flags in addition to the normal Empty and Full flags. The embedded FIFO control unit contains the counters necessary for generation of the read and write address pointers. The embedded SRAM/FIFO blocks can be cascaded to create larger configurations.

PLL and CCC

IGLOO devices provide designers with very flexible clock conditioning circuit (CCC) capabilities. Each member of the IGLOO family contains six CCCs. One CCC (center west side) has a PLL. The AGL015 and AGL030 do not have a PLL.

The six CCC blocks are located at the four corners and the centers of the east and west sides. One CCC (center west side) has a PLL.

All six CCC blocks are usable; the four corner CCCs and the east CCC allow simple clock delay operations as well as clock spine access.

The inputs of the six CCC blocks are accessible from the FPGA core or from one of several inputs located near the CCC that have dedicated connections to the CCC block.

The CCC block has these key features:

Wide Range I/O Support

IGLOO devices support JEDEC-defined wide range I/O operation. IGLOO devices support both the JESD8-B specification, covering 3 V and 3.3 V supplies, for an effective operating range of 2.7 V to 3.6 V, and JESD8-12 with its 1.2 V nominal, supporting an effective operating range of 1.14 V to 1.575 V.

Wider I/O range means designers can eliminate power supplies or power conditioning components from the board or move to less costly components with greater tolerances. Wide range eases I/O bank management and provides enhanced protection from system voltage spikes, while providing the flexibility to easily run custom voltage applications.

Specifying I/O States During Programming

You can modify the I/O states during programming in FlashPro. In FlashPro, this feature is supported for PDB files generated from Designer v8.5 or greater. See the *FlashPro User Guide* for more information.

Note: PDB files generated from Designer v8.1 to Designer v8.4 (including all service packs) have limited display of Pin Numbers only.

1. Load a PDB from the FlashPro GUI. You must have a PDB loaded to modify the I/O states during programming.
2. From the FlashPro GUI, click PDB Configuration. A FlashPoint – Programming File Generator window appears.
3. Click the Specify I/O States During Programming button to display the Specify I/O States During Programming dialog box.
4. Sort the pins as desired by clicking any of the column headers to sort the entries by that header. Select the I/Os you wish to modify (Figure 1-5 on page 1-9).
5. Set the I/O Output State. You can set Basic I/O settings if you want to use the default I/O settings for your pins, or use Custom I/O settings to customize the settings for each pin. Basic I/O state settings:

   1 – I/O is set to drive out logic High

   0 – I/O is set to drive out logic Low

   Last Known State – I/O is set to the last value that was driven out prior to entering the programming mode, and then held at that value during programming

   Z -Tri-State: I/O is tristated

Table 2-17 • Summary of I/O Output Buffer Power (per pin) – Default I/O Software Settings[1] Applicable to Standard Plus I/O Banks

	C_{LOAD} (pF)	VCCI (V)	Static Power PDC7 (mW)[2]	Dynamic Power PAC10 (µW/MHz)[3]
Single-Ended				
3.3 V LVTTL / 3.3 V LVCMOS	5	3.3	–	122.16
3.3 V LVCMOS Wide Range[4]	5	3.3	–	122.16
2.5 V LVCMOS	5	2.5	–	68.37
1.8 V LVCMOS	5	1.8	–	34.53
1.5 V LVCMOS (JESD8-11)	5	1.5	–	23.66
1.2 V LVCMOS[5]	5	1.2	–	14.90
1.2 V LVCMOS Wide Range[5]	5	1.2	–	14.90
3.3 V PCI	10	3.3	–	181.06
3.3 V PCI-X	10	3.3	–	181.06

Notes:

1. *Dynamic power consumption is given for standard load and software default drive strength and output slew.*
2. *P_{DC7} is the static power (where applicable) measured on VCCI.*
3. *P_{AC10} is the total dynamic power measured on VCCI.*
4. *All LVCMOS 3.3 V software macros support LVCMOS 3.3 V wide range as specified in the JESD-8B specification.*
5. *Applicable for IGLOO V2 devices only.*

Table 2-18 • Summary of I/O Output Buffer Power (per pin) – Default I/O Software Settings[1] Applicable to Standard I/O Banks

	C_{LOAD} (pF)	VCCI (V)	Static Power PDC7 (mW)[2]	Dynamic Power PAC10 (µW/MHz)[3]
Single-Ended

Revision / Version	Changes	Page
Revision 3 (Feb 2008) Product Brief rev. 2	This document was updated to include AGL015 device information. QN68 is a new package offered in the AGL015. The following sections were updated: "Features and Benefits" "IGLOO Ordering Information" "Temperature Grade Offerings" "IGLOO Devices" Product Family Table Table 1 • IGLOO FPGAs Package Sizes Dimensions "AGL015 and AGL030" note	N/A
	The "Temperature Grade Offerings" table was updated to include M1AGL600.	IV
	In the "IGLOO Ordering Information" table, the QN package measurements were updated to include both 0.4 mm and 0.5 mm.	III
	In the "General Description" section, the number of I/Os was updated from 288 to 300.	1-1
Packaging v1.2	The "QN68" section is new.	4-25
Revision 2 (Jan 2008) Packaging v1.1	The "CS196" package and pin table was added for AGL125.	4-10
Revision 1 (Jan 2008) Product Brief rev. 1	The "Low Power" section was updated to change the description of low power active FPGA operation to "from 12 µW" from "from 25 µW." The same update was made in the "General Description" section and the "Flash*Freeze Technology" section.	I, 1-1
Revision 0 (Jan 2008)	This document was previously in datasheet Advance v0.7. As a result of moving to the handbook format, Actel has restarted the numbering.	N/A
Advance v0.7 (December 2007)	Table 1 • IGLOO Product Family, the "I/Os Per Package1" table, and the Temperature Grade Offerings table were updated to reflect the following: CS196 is now supported for AGL250; device/package support for QN132 is to be determined for AGL250; the CS281 package was added for AGL600 and AGL1000.	i, ii, iv
	Table 2 • IGLOO FPGAs Package Sizes Dimensions is new, and package sizes were removed from the "I/Os Per Package1" table.	ii
	The "I/Os Per Package1"table was updated to reflect 77 instead of 79 single-ended I/Os for the VG100 package for AGL030.	ii
	The "Timing Model" was updated to be consistent with the revised timing numbers.	2-20
	In Table 2-27 • Summary of Maximum and Minimum DC Input and Output Levels Applicable to Commercial and Industrial Conditions—Software Default Settings, T_J was changed to T_A in notes 1 and 2.	2-26
	All AC Loading figures for single-ended I/O standards were changed from Datapaths at 35 pF to 5 pF.	N/A
	The "1.2 V LVCMOS (JESD8-12A)" section is new.	2-74
	This document was previously in datasheet Advance v0.7. As a result of moving to the handbook format, Actel has restarted the version numbers. The new version number is Advance v0.1.	N/A
	Table 2-4 • IGLOO CCC/PLL Specification and Table 2-5 • IGLOO CCC/PLL Specification were updated.	2-19, 2-20
