Understanding **Embedded - FPGAs (Field Programmable Gate Array)**

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Notes:

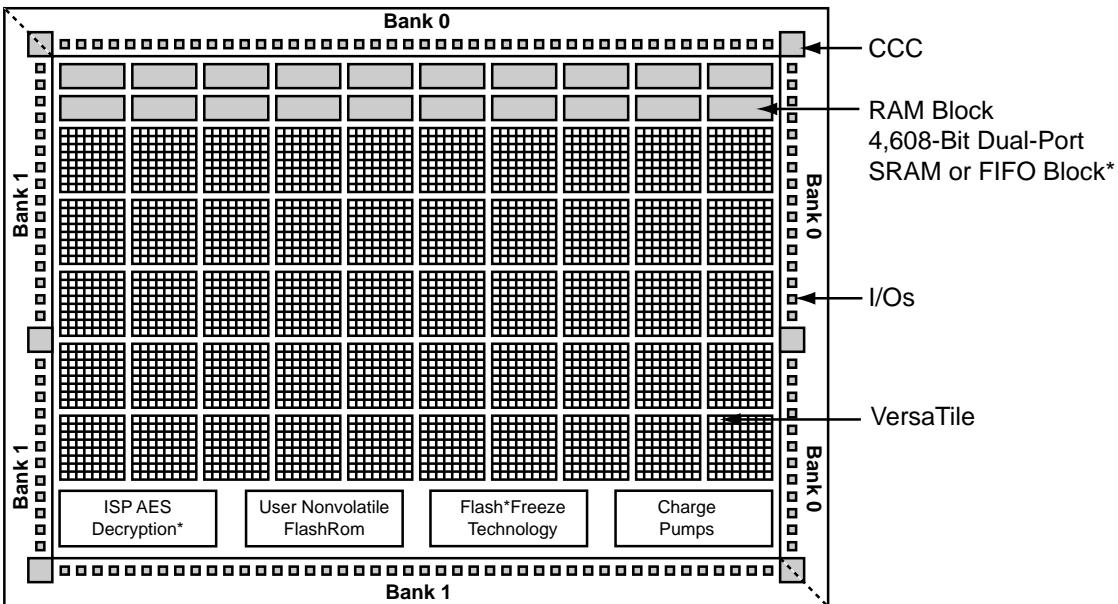

- When considering migrating your design to a lower- or higher-density device, refer to the IGLOO FPGA Fabric User Guide to ensure compliance with design and board migration requirements.
- AGL015 is not recommended for new designs.
- When the Flash*Freeze pin is used to directly enable Flash*Freeze mode and not used as a regular I/O, the number of single-ended user I/Os available is reduced by one.
- Each used differential I/O pair reduces the number of single-ended I/Os available by two.
- The M1AGL250 device does not support QN132 or CS196 packages.
- Package not available.
- FG256 and FG484 are footprint-compatible packages.

Wide Range I/O Support

IGLOO devices support JEDEC-defined wide range I/O operation. IGLOO devices support both the JESD8-B specification, covering 3 V and 3.3 V supplies, for an effective operating range of 2.7 V to 3.6 V, and JESD8-12 with its 1.2 V nominal, supporting an effective operating range of 1.14 V to 1.575 V.

Wider I/O range means designers can eliminate power supplies or power conditioning components from the board or move to less costly components with greater tolerances. Wide range eases I/O bank management and provides enhanced protection from system voltage spikes, while providing the flexibility to easily run custom voltage applications.

Specifying I/O States During Programming

You can modify the I/O states during programming in FlashPro. In FlashPro, this feature is supported for PDB files generated from Designer v8.5 or greater. See the *FlashPro User Guide* for more information.

Note: PDB files generated from Designer v8.1 to Designer v8.4 (including all service packs) have limited display of Pin Numbers only.

1. Load a PDB from the FlashPro GUI. You must have a PDB loaded to modify the I/O states during programming.
2. From the FlashPro GUI, click PDB Configuration. A FlashPoint – Programming File Generator window appears.
3. Click the Specify I/O States During Programming button to display the Specify I/O States During Programming dialog box.
4. Sort the pins as desired by clicking any of the column headers to sort the entries by that header. Select the I/Os you wish to modify (Figure 1-5 on page 1-9).
5. Set the I/O Output State. You can set Basic I/O settings if you want to use the default I/O settings for your pins, or use Custom I/O settings to customize the settings for each pin. Basic I/O state settings:

1 – I/O is set to drive out logic High

0 – I/O is set to drive out logic Low

Last Known State – I/O is set to the last value that was driven out prior to entering the programming mode, and then held at that value during programming

Z -Tri-State: I/O is tristated

Single-Ended I/O Characteristics

3.3 V LVTTL / 3.3 V LVCMOS

Low-Voltage Transistor–Transistor Logic (LVTTL) is a general-purpose standard (EIA/JESD) for 3.3 V applications. It uses an LVTTL input buffer and push-pull output buffer. Furthermore, all LVCMOS 3.3 V software macros comply with LVCMOS 3.3 V wide range as specified in the JESD8a specification.

Notes:

1. *IIL* is the input leakage current per I/O pin over recommended operation conditions where $-0.3 \text{ V} < \text{VIN} < \text{VIL}$.
2. *IIH* is the input leakage current per I/O pin over recommended operating conditions $\text{VIH} < \text{VIN} < \text{VCCI}$. Input current is larger when operating outside recommended ranges.
3. Currents are measured at 100°C junction temperature and maximum voltage.
4. Currents are measured at 85°C junction temperature.
5. Software default selection highlighted in gray.

Revision / Version	Changes	Page
Advance v0.4 (September 2007)	Cortex-M1 device information was added to Table 1 • IGLOO Product Family, the "I/Os Per Package1" table, "IGLOO Ordering Information", and Temperature Grade Offerings.	i, ii, iii, iv
	The number of single-ended I/Os for the CS81 package for AGL030 was updated to 66 in the "I/Os Per Package1" table.	ii
	The "Power Conservation Techniques" section was updated to recommend that unused I/O signals be left floating.	2-51
Advance v0.3 (August 2007)	In Table 1 • IGLOO Product Family, the CS81 package was added for AGL030. The CS196 was replaced by the CS121 for AGL060. Table note 3 was moved to the specific packages to which it applies for AGL060: QN132 and FG144.	i
	The CS81 and CS121 packages were added to the "I/Os Per Package1" table. The number of single-ended I/Os was removed for the CS196 package in AGL060. Table note 6 was moved to the specific packages to which it applies for AGL060: QN132 and FG144.	ii
	The CS81 and CS121 packages were added to the Temperature Grade Offerings table. The temperature grade offerings were removed for the CS196 package in AGL060. Table note 3 was moved to the specific packages to which it applies for AGL060: QN132 and FG144.	iv
	The CS81 and CS121 packages were added to Table 2-31 • Flash*Freeze Pin Location in IGLOO Family Packages (device-independent).	2-61
Advance v0.2	The words "ambient temperature" were added to the temperature range in the "IGLOO Ordering Information", Temperature Grade Offerings, and "Speed Grade and Temperature Grade Matrix" sections.	iii, iv
	The T_J parameter in Table 3-2 • Recommended Operating Conditions was changed to T_A , ambient temperature, and table notes 4–6 were added.	3-2
