Embedded - System On Chip (SoC): The Heart of Modern Embedded Systems

Embedded - System On Chip (SoC) refers to an integrated circuit that consolidates all the essential components of a computer system into a single chip. This includes a microprocessor, memory, and other peripherals, all packed into one compact and efficient package. SoCs are designed to provide a complete computing solution, optimizing both space and power consumption, making them ideal for a wide range of embedded applications.

What are Embedded - System On Chip (SoC)?

System On Chip (SoC) integrates multiple functions of a computer or electronic system onto a single chip. Unlike traditional multi-chip solutions, SoCs combine a central

Power Supply Sequencing

PS Power-On/Off Power Supply Sequencing

The low-power domain (LPD) must operate before the full-power domain (FPD) can function. The low-power and full-power domains can be powered simultaneously. The PS_POR_B input must be asserted to GND during the power-on sequence (see [Table 37](#)). The FPD (when used) must be powered before PS_POR_B is released.

To achieve minimum current draw and ensure that the I/Os are 3-stated at power-on, the recommended power-on sequence for the low-power domain (LPD) is listed. The recommended power-off sequence is the reverse of the power-on sequence.

1. $V_{CC_PSINTLP}$
2. V_{CC_PSAUX} , V_{CC_PSADC} , and V_{CC_PSPLL} in any order or simultaneously.
3. V_{CCO_PSIO}

To achieve minimum current draw and ensure that the I/Os are 3-stated at power-on, the recommended power-on sequence for the full-power domain (FPD) is listed. The recommended power-off sequence is the reverse of the power-on sequence.

1. $V_{CC_PSINTFP}$ and $V_{CC_PSINTFP_DDR}$ driven from the same supply source.
2. $V_{PS_MGTRAVCC}$ and $V_{CC_PSDDR_PLL}$ in any order or simultaneously.
3. $V_{PS_MGTRAVTT}$ and V_{CCO_PSDDR} in any order or simultaneously.

PL Power-On/Off Power Supply Sequencing

The recommended power-on sequence is V_{CCINT} , $V_{CCINT_IO}/V_{CCBRAM}/V_{CCINT_VCU}$, V_{CCAUX}/V_{CCAUX_IO} , and V_{CCO} to achieve minimum current draw and ensure that the I/Os are 3-stated at power-on. The recommended power-off sequence is the reverse of the power-on sequence. If V_{CCINT} and V_{CCINT_IO}/V_{CCBRAM} have the same recommended voltage levels, they can be powered by the same supply and ramped simultaneously. V_{CCINT_IO} must be connected to V_{CCBRAM} . If V_{CCAUX}/V_{CCAUX_IO} and V_{CCO} have the same recommended voltage levels, they can be powered by the same supply and ramped simultaneously. V_{CCAUX} and V_{CCAUX_IO} must be connected together. V_{CCADC} and V_{REF} can be powered at any time and have no power-up sequencing requirements.

The recommended power-on sequence to achieve minimum current draw for the GTH or GTY transceivers is V_{CCINT} , $V_{MGTAVCC}$, $V_{MGTAVTT}$ OR $V_{MGTAVCC}$, V_{CCINT} , $V_{MGTAVTT}$. There is no recommended sequencing for $V_{MGTAVCCAUX}$. Both $V_{MGTAVCC}$ and V_{CCINT} can be ramped simultaneously. The recommended power-off sequence is the reverse of the power-on sequence to achieve minimum current draw.

If these recommended sequences are not met, current drawn from $V_{MGTAVTT}$ can be higher than specifications during power-up and power-down.

PS-PL Power Sequencing

The PS and PL power supplies are fully independent. All PS power supplies can be powered before or after any PL power supplies. The PS and PL power regions are isolated to prevent damage.

Power Supply Requirements

[Table 10](#) shows the minimum current, in addition to I_{CCQ} maximum, required by each Zynq UltraScale+ device for proper power-on and configuration. If the current minimums shown in [Table 10](#) are met, the device powers on after all supplies have passed through their power-on reset threshold voltages. The device must not be configured until after V_{CCINT} is applied. Once initialized and configured, use the Xilinx Power Estimator (XPE) tools to estimate current drain on these supplies.

Notes:

1. Native mode is supported through the [High-Speed SelectIO Interface Wizard](#) available with the Vivado Design Suite. The performance values assume a source-synchronous interface.
2. PLL settings can restrict the minimum allowable data rate. For example, when using the PLL with CLKOUTPHY_MODE = VCO_HALF the minimum frequency is $\text{PLL_FVCOMIN}/2$.
3. In the SBVA484 package, the maximum data rate is 1260 Mb/s for DDR interfaces and 630 Mb/s for SDR interfaces.
4. LVDS receivers are typically bounded with certain applications to achieve maximum performance. Package skews are not included and should be removed through PCB routing.

Notes:

1. Clocking must be implemented as described in the *UltraScale Architecture GTY Transceiver User Guide* ([UG578](#)).
2. For speed grades -3E, -2E, and -2I, a 16-bit and 20-bit internal data path can only be used for line rates less than 8.1875 Gb/s.
3. For speed grade -2LE, a 16-bit and 20-bit internal data path can only be used for line rates less than 8.1875 Gb/s when $V_{CCINT} = 0.85V$ or 6.25 Gb/s when $V_{CCINT} = 0.72V$.
4. For speed grades -1E and -1I, a 16-bit and 20-bit internal data path can only be used for line rates less than 6.25 Gb/s.
5. For speed grade -1LI, a 16-bit and 20-bit internal data path can only be used for line rates less than 6.25 Gb/s when $V_{CCINT} = 0.85V$ or 5.15625 Gb/s when $V_{CCINT} = 0.72V$.
6. When the gearbox is used, these maximums refer to the XCLK. For more information, see the *Valid Data Width Combinations for TX Asynchronous Gearbox* table in the *UltraScale Architecture GTY Transceiver User Guide* ([UG578](#)).
