Embedded - System On Chip (SoC): The Heart of Modern Embedded Systems

Embedded - System On Chip (SoC) refers to an integrated circuit that consolidates all the essential components of a computer system into a single chip. This includes a microprocessor, memory, and other peripherals, all packed into one compact and efficient package. SoCs are designed to provide a complete computing solution, optimizing both space and power consumption, making them ideal for a wide range of embedded applications.

What are Embedded - System On Chip (SoC)?

System On Chip (SoC) integrates multiple functions of a computer or electronic system onto a single chip. Unlike traditional multi-chip solutions, SoCs combine a central

Notes:

1. Stresses beyond those listed under Absolute Maximum Ratings might cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those listed under Operating Conditions is not implied. Exposure to Absolute Maximum Ratings conditions for extended periods of time might affect device reliability.
2. When operating outside of the recommended operating conditions, refer to Table 6, Table 7, and Table 8 for maximum overshoot and undershoot specifications.
3. V_{CCINT_IO} must be connected to V_{CCBRAM}.
4. V_{CCAUX_IO} must be connected to V_{CCAUX}.
5. The lower absolute voltage specification always applies.
6. If V_{CCO} is 3.3V, the maximum voltage is 3.4V.
7. For I/O operation, see the *UltraScale Architecture SelectIO Resources User Guide* (UG571).
8. AC coupled operation is not supported for RX termination = floating.
9. For GTY transceivers, DC coupled operation is not supported for RX termination = GND.
10. DC coupled operation is not supported for RX termination = programmable.
11. For more information on supported GTH or GTY transceiver terminations see the *UltraScale Architecture GTH Transceiver User Guide* (UG576) or *UltraScale Architecture GTY Transceiver User Guide* (UG578).
12. For soldering guidelines and thermal considerations, see the *Zynq UltraScale+ MPSoC Packaging and Pinout Specifications* (UG1075).

Notes:

1. All voltages are relative to GND.
2. For the design of the power distribution system consult *UltraScale Architecture PCB Design Guide* (UG583).
3. $V_{CC\_PSINTFP\_DDR}$ must be tied to $V_{CC\_PSINTFP}$.
4. Includes V_{CCO_PSDDR} of 1.2V, 1.35V, 1.5V at ±5% and 1.1V +0.07V/–0.04V depending upon the tolerances required by specific memory standards.
5. Applies to all PS I/O supply banks. Includes V_{CCO_PSIO} of 1.8V, 2.5V, and 3.3V at ±5%.
6. If the battery-backed RAM or RTC is not used, connect V_{CC_PSBATT} to GND or V_{CC_PSAUX}. The V_{CC_PSAUX} maximum of 1.89V is acceptable on an unused V_{CC_PSBATT}.
7. V_{CCINT_IO} must be connected to V_{CCBRAM}.
8. Includes V_{CCO} of 1.0V (HP I/O only), 1.2V, 1.35V, 1.5V, 1.8V, 2.5V (HD I/O only) at ±5%, and 3.3V (HD I/O only) at +3/–5%.
9. V_{CCAUX_IO} must be connected to V_{CCAUX}.
10. The lower absolute voltage specification always applies.
11. A total of 200 mA per bank should not be exceeded.
12. Each voltage listed requires filtering as described in *UltraScale Architecture GTH Transceiver User Guide* (UG576) or *UltraScale Architecture GTY Transceiver User Guide* (UG578).
13. Xilinx recommends measuring the Tj of a device using the system monitor as described in the *UltraScale Architecture System Monitor User Guide* (UG580). The SYSMON temperature measurement errors (that are described in Table 69 and Table 124) must be accounted for in your design. For example, when using the PL system monitor with an external reference of 1.25V, when SYSMON reports 97°C, there is a measurement error ±3°C. A reading of 97°C is considered the maximum adjusted Tj (100°C – 3°C = 97°C).
14. Devices labeled with the speed/temperature grade of -2LE normally operate under Extended (E) temperature grade specifications with a maximum junction temperature of 100°C. However, E temperature grade devices can operate for a limited time at a junction temperature of 110°C. Timing parameters adhere to the same speed file at 110°C as they do at 100°C, regardless of operating voltage (nominal voltage of 0.85V or a low-voltage of 0.72V). Operation at Tj = 110°C is limited to 1% of the device lifetime and can occur sequentially or at regular intervals as long as the total time does not exceed 1% of the device lifetime.

Notes:

1. Typical values are specified at nominal voltage, 85°C junction temperatures (T_j) with single-ended SelectIO™ resources.
2. Typical values are for blank configured devices with no output current loads, no active input pull-up resistors, all I/O pins are 3-state and floating.
3. Use the Xilinx Power Estimator (XPE) spreadsheet tool (download at www.xilinx.com/power) to estimate static power consumption for conditions or supplies other than those specified.
4. Typical values depend upon your configuration. To accurately estimate all PS supply currents, use the interactive XPE spreadsheet tool.

Speed Grade Designations

Since individual family members are produced at different times, the migration from one category to another depends completely on the status of the fabrication process for each device. Table 26 correlates the current status of the Zynq UltraScale+ MPSoC on a per speed grade basis. See Table 3 for operating voltages listed by speed grade.

Programmable Logic (PL) Switching Characteristics

Table 75 (high-density IOB (HD)) and Table 76 (high-performance IOB (HP)) summarizes the values of standard-specific data input delay adjustments, output delays terminating at pads (based on standard) and 3-state delays.

- $T_{INBUF\_DELAY\_PAD\_I}$ is the delay from IOB pad through the input buffer to the I-pin of an IOB pad. The delay varies depending on the capability of the SelectIO input buffer.
- $T_{OUTBUF\_DELAY\_O\_PAD}$ is the delay from the O pin to the IOB pad through the output buffer of an IOB pad. The delay varies depending on the capability of the SelectIO output buffer.
- $T_{OUTBUF\_DELAY\_TD\_PAD}$ is the delay from the T pin to the IOB pad through the output buffer of an IOB pad, when 3-state is disabled. The delay varies depending on the SelectIO capability of the output buffer. In HP I/O banks, the internal DCI termination turn-on time is always faster than $T_{OUTBUF\_DELAY\_TD\_PAD}$ when the DCITERMDISABLE pin is used. In HD I/O banks, the on-die termination turn-on time is always faster than $T_{OUTBUF\_DELAY\_TD\_PAD}$ when the INTERMDISABLE pin is used.

Device Pin-to-Pin Input Parameter Guidelines

The pin-to-pin numbers in Table 90 and Table 91 are based on the clock root placement in the center of the device. The actual pin-to-pin values will vary if the root placement selected is different. Consult the Vivado Design Suite timing report for the actual pin-to-pin values.

Notes:

1. Setup and hold times are measured over worst case conditions (process, voltage, temperature). Setup time is measured relative to the global clock input signal using the slowest process, slowest temperature, and slowest voltage. Hold time is measured relative to the global clock input signal using the fastest process, fastest temperature, and fastest voltage.
2. This table lists representative values where one global clock input drives one vertical clock line in each accessible column, and where all accessible I/O and CLB flip-flops are clocked by the global clock net.
3. Use IBIS to determine any duty-cycle distortion incurred using various standards.
