Embedded - System On Chip (SoC): The Heart of Modern Embedded Systems

Embedded - System On Chip (SoC) refers to an integrated circuit that consolidates all the essential components of a computer system into a single chip. This includes a microprocessor, memory, and other peripherals, all packed into one compact and efficient package. SoCs are designed to provide a complete computing solution, optimizing both space and power consumption, making them ideal for a wide range of embedded applications.

What are Embedded - System On Chip (SoC)?

System On Chip (SoC) integrates multiple functions of a computer or electronic system onto a single chip. Unlike traditional multi-chip solutions, SoCs combine a central

Notes:

1. All voltages are relative to GND.
2. For the design of the power distribution system consult *UltraScale Architecture PCB Design Guide* (UG583).
3. $V_{CC\_PSINTFP\_DDR}$ must be tied to $V_{CC\_PSINTFP}$.
4. Includes V_{CCO_PSDDR} of 1.2V, 1.35V, 1.5V at ±5% and 1.1V +0.07V/–0.04V depending upon the tolerances required by specific memory standards.
5. Applies to all PS I/O supply banks. Includes V_{CCO_PSIO} of 1.8V, 2.5V, and 3.3V at ±5%.
6. If the battery-backed RAM or RTC is not used, connect V_{CC_PSBATT} to GND or V_{CC_PSAUX}. The V_{CC_PSAUX} maximum of 1.89V is acceptable on an unused V_{CC_PSBATT}.
7. V_{CCINT_IO} must be connected to V_{CCBRAM}.
8. Includes V_{CCO} of 1.0V (HP I/O only), 1.2V, 1.35V, 1.5V, 1.8V, 2.5V (HD I/O only) at ±5%, and 3.3V (HD I/O only) at +3/–5%.
9. V_{CCAUX_IO} must be connected to V_{CCAUX}.
10. The lower absolute voltage specification always applies.
11. A total of 200 mA per bank should not be exceeded.
12. Each voltage listed requires filtering as described in *UltraScale Architecture GTH Transceiver User Guide* (UG576) or *UltraScale Architecture GTY Transceiver User Guide* (UG578).
13. Xilinx recommends measuring the Tj of a device using the system monitor as described in the *UltraScale Architecture System Monitor User Guide* (UG580). The SYSMON temperature measurement errors (that are described in Table 69 and Table 124) must be accounted for in your design. For example, when using the PL system monitor with an external reference of 1.25V, when SYSMON reports 97°C, there is a measurement error ±3°C. A reading of 97°C is considered the maximum adjusted Tj (100°C – 3°C = 97°C).
14. Devices labeled with the speed/temperature grade of -2LE normally operate under Extended (E) temperature grade specifications with a maximum junction temperature of 100°C. However, E temperature grade devices can operate for a limited time at a junction temperature of 110°C. Timing parameters adhere to the same speed file at 110°C as they do at 100°C, regardless of operating voltage (nominal voltage of 0.85V or a low-voltage of 0.72V). Operation at Tj = 110°C is limited to 1% of the device lifetime and can occur sequentially or at regular intervals as long as the total time does not exceed 1% of the device lifetime.

Table 3 describes the speed grades per device and the V_{CCINT} operating supply voltages for the full-power, low-power, and DDR domains. For more information on selecting devices and speed grades, see the *UltraScale Architecture and Product Overview* (DS890).

PS-PL Power Sequencing

The PS and PL power supplies are fully independent. All PS power supplies can be powered before or after any PL power supplies. The PS and PL power regions are isolated to prevent damage.

Power Supply Requirements

Table 10 shows the minimum current, in addition to I_{CCQ} maximum, required by each Zynq UltraScale+ device for proper power-on and configuration. If the current minimums shown in Table 10 are met, the device powers on after all supplies have passed through their power-on reset threshold voltages. The device must not be configured until after V_{CCINT} is applied. Once initialized and configured, use the Xilinx Power Estimator (XPE) tools to estimate current drain on these supplies.

IOB 3-state Output Switching Characteristics

Table 77 specifies the values of $T_{OUTBUF\_DELAY\_TE\_PAD}$ and $T_{INBUF\_DELAY\_IBUFDIS\_O}$. $T_{OUTBUF\_DELAY\_TE\_PAD}$ is the delay from the T pin to the IOB pad through the output buffer of an IOB pad, when 3-state is enabled (i.e., a high impedance state). $T_{INBUF\_DELAY\_IBUFDIS\_O}$ is the IOB delay from IBUFDISABLE to O output. In HP I/O banks, the internal DCI termination turn-off time is always faster than $T_{OUTBUF\_DELAY\_TE\_PAD}$ when the DCITERMDISABLE pin is used. In HD I/O banks, the internal IN_TERM termination turn-off time is always faster than $T_{OUTBUF\_DELAY\_TE\_PAD}$ when the INTERMDISABLE pin is used.
