

Welcome to [E-XFL.COM](https://www.e-xfl.com)

Understanding [Embedded - FPGAs \(Field Programmable Gate Array\)](#)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Details

Product Status	Obsolete
Number of LABs/CLBs	-
Number of Logic Elements/Cells	-
Total RAM Bits	2560
Number of I/O	202
Number of Gates	54000
Voltage - Supply	3V ~ 3.6V, 4.5V ~ 5.5V
Mounting Type	Surface Mount
Operating Temperature	-55°C ~ 125°C (TC)
Package / Case	240-BFQFP
Supplier Device Package	240-PQFP (32x32)
Purchase URL	https://www.e-xfl.com/product-detail/microsemi/a42mx36-1pqg240m

Contact your local *Microsemi Sales representative* for device availability.

Figure 2 • 42MX C-Module Implementation

The 42MX devices contain three types of logic modules: combinatorial (C-modules), sequential (S-modules) and decode (D-modules). The following figure illustrates the combinatorial logic module. The S-module, shown in Figure 4, page 8, implements the same combinatorial logic function as the C-module while adding a sequential element. The sequential element can be configured as either a D-flip-flop or a transparent latch. The S-module register can be bypassed so that it implements purely combinatorial logic.

Figure 3 • 42MX C-Module Implementation

Designer software development tools provide a design library of I/O macro functions that can implement all I/O configurations supported by the MX FPGAs.

Figure 10 • 42MX I/O Module

Note: *Can be configured as a Latch or D Flip-Flop (Using C-Module)

Figure 11 • PCI Output Structure of A42MX24 and A42MX36 Devices

3.3 Other Architectural Features

The following sections cover other architectural features of 40MX and 42MX FPGAs.

3.3.1 Performance

MX devices can operate with internal clock frequencies of 250 MHz, enabling fast execution of complex logic functions. MX devices are live on power-up and do not require auxiliary configuration devices and thus are an optimal platform to integrate the functionality contained in multiple programmable logic devices. In addition, designs that previously would have required a gate array to meet performance can be integrated into an MX device with improvements in cost and time-to-market. Using timing-driven place-and-route (TDPR) tools, designers can achieve highly deterministic device performance.

3.3.2 User Security

Microsemi FuseLock provides robust security against design theft. Special security fuses are hidden in the fabric of the device and protect against unauthorized users attempting to access the programming and/or probe interfaces. It is virtually impossible to identify or bypass these fuses without damaging the device, making Microsemi antifuse FPGAs protected with the highest level of security available from both invasive and noninvasive attacks.

Special security fuses in 40MX devices include the Probe Fuse and Program Fuse. The former disables the probing circuitry while the latter prohibits further programming of all fuses, including the Probe Fuse. In 42MX devices, there is the Security Fuse which, when programmed, both disables the probing circuitry and prohibits further programming of the device.

3.3.3 Programming

Device programming is supported through the Silicon Sculptor series of programmers. Silicon Sculptor is a compact, robust, single-site and multi-site device programmer for the PC. With standalone software, Silicon Sculptor is designed to allow concurrent programming of multiple units from the same PC.

3.10.2 Sequential Module Timing Characteristics

The following figure shows sequential module timing characteristics.

Figure 25 • Flip-Flops and Latches

Note: *D represents all data functions involving A, B, and S for multiplexed flip-flops.

3.10.3 Sequential Timing Characteristics

The following figures show sequential timing characteristics.

Figure 26 • Input Buffer Latches

1. For dual-module macros, use t_{PD1} + t_{RD1} + t_{PDn}, t_{CO} + t_{RD1} + t_{PDn}, or t_{PD1} + t_{RD1} + t_{SUD}, whichever is appropriate.
2. Routing delays are for typical designs across worst-case operating conditions. These parameters should be used for estimating device performance. Post-route timing analysis or simulation is required to determine actual performance.
3. Data applies to macros based on the S-module. Timing parameters for sequential macros constructed from C-modules can be obtained from the Timer utility.
4. Set-up and hold timing parameters for the Input Buffer Latch are defined with respect to the PAD and the D input. External setup/hold timing parameters must account for delay from an external PAD signal to the G inputs. Delay from an external PAD signal to the G input subtracts (adds) to the internal setup (hold) time.
5. Delays based on 35 pF loading.

Table 44 • A42MX36 Timing Characteristics (Nominal 5.0 V Operation)(Worst-Case Commercial Conditions, VCCA = 4.75 V, T_J = 70°C)

Parameter / Description			–3 Speed		–2 Speed		–1 Speed		Std Speed		–F Speed		Units
			Min.	Max.	Min.	Max.	Min.	Max.	Min.	Max.	Min.	Max.

		FO = 635	6.0		6.6		7.2		8.3		13.8		ns
f _{MAX}	Maximum Datapath Frequency	FO = 32		180		164		151		131		79	MHz
		FO = 635		166		151		139		121		73	MHz
TTL Output Module Timing ⁵													
t _{DLH}	Data-to-Pad HIGH			2.6		2.8		3.2		3.8		5.3	ns
t _{DHL}	Data-to-Pad LOW			3.0		3.3		3.7		4.4		6.2	ns
t _{ENZH}	Enable Pad Z to HIGH			2.7		3.0		3.3		3.9		5.5	ns
t _{ENZL}	Enable Pad Z to LOW			3.0		3.3		3.7		4.3		6.1	ns
t _{ENHZ}	Enable Pad HIGH to Z			5.3		5.8		6.6		7.8		10.9	ns

Input, output, tristate or bidirectional buffer. Input and output levels are compatible with standard TTL and CMOS specifications. Unused I/Os pins are configured by the Designer software as shown in Table 46, page 84.

Table 46 • Configuration of Unused I/Os

Device	Configuration
A40MX02, A40MX04	Pulled LOW
A42MX09, A42MX16	Pulled LOW
A42MX24, A42MX36	Tristated

In all cases, it is recommended to tie all unused MX I/O pins to LOW on the board. This applies to all dual-purpose pins when configured as I/Os as well.

LP, Low Power Mode

Controls the low power mode of all 42MX devices. The device is placed in the low power mode by connecting the LP pin to logic HIGH. In low power mode, all I/Os are tristated, all input buffers are turned OFF, and the core of the device is turned OFF. To exit the low power mode, the LP pin must be set LOW. The device enters the low power mode 800 ns after the LP pin is driven to a logic HIGH. It will resume normal operation in 200 μ s after the LP pin is driven to a logic LOW.

MODE, Mode

Controls the use of multifunction pins (DCLK, PRA, PRB, SDI, TDO). The MODE pin is held HIGH to provide verification capability. The MODE pin should be terminated to GND through a 10k Ω resistor so that the MODE pin can be pulled HIGH when required.

NC, No Connection

This pin is not connected to circuitry within the device. These pins can be driven to any voltage or can be left floating with no effect on the operation of the device.

PRA, I/O

PRB, I/OProbe A/B

The Probe pin is used to output data from any user-defined design node within the device. Each diagnostic pin can be used in conjunction with the other probe pin to allow real-time diagnostic output of any signal path within the device. The Probe pin can be used as a user-defined I/O when verification has been completed. The pin's probe capabilities can be permanently disabled to protect programmed design confidentiality. The Probe pin is accessible when the MODE pin is HIGH. This pin functions as an I/O when the MODE pin is LOW.

QCLKA/B/C/D, I/O Quadrant Clock

Quadrant clock inputs for A42MX36 devices. When not used as a register control signal, these pins can function as user I/Os.

SDI, I/O Serial Data Input

Serial data input for diagnostic probe and device programming. SDI is active when the MODE pin is HIGH. This pin functions as an I/O when the MODE pin is LOW.

SDO, I/O Serial Data Output

Serial data output for diagnostic probe and device programming. SDO is active when the MODE pin is HIGH. This pin functions as an I/O when the MODE pin is LOW. SDO is available for 42MX devices only.

When Silicon Explorer II is being used, SDO will act as an output while the "checksum" command is run. It will return to user I/O when "checksum" is complete.

TCK, I/O Test Clock
