What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

REGISTER 11-1: USBCSR0: USB CONTROL STATUS REGISTER 0 (CONTINUED)

bit 10 **RESUME:** Resume from Suspend control bit
1 = Generate Resume signaling when the device is in Suspend mode
0 = Stop Resume signaling

In *Device mode*, the software should clear this bit after 10 ms (a maximum of 15 ms) to end Resume signaling. In *Host mode*, the software should clear this bit after 20 ms.

bit 9 **SUSPMODE:** Suspend Mode status bit
1 = The USB module is in Suspend mode
0 = The USB module is in Normal operations

This bit is read-only in Device mode. In Host mode, it can be set by software, and is cleared by hardware.

bit 8 **SUSPEN:** Suspend Mode Enable bit
1 = Suspend mode is enabled
0 = Suspend mode is not enabled

bit 7 **Unimplemented:** Read as '0'

bit 6-0 **FUNC<6:0>:** Device Function Address bits

These bits are only available in *Device mode*. This field is written with the address received through a SET_ADDRESS command, which will then be used for decoding the function address in subsequent token packets.

23.0 PARALLEL MASTER PORT (PMP)

Note: This data sheet summarizes the features of the PIC32MZ EF family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 13. "Parallel Master Port (PMP)"** (DS60001128) in the *"PIC32 Family Reference Manual"*, which is available from the Microchip web site (www.microchip.com/PIC32).

The PMP is a parallel 8-bit/16-bit input/output module specifically designed to communicate with a wide variety of parallel devices, such as communications peripherals, LCDs, external memory devices and microcontrollers. Because the interface to parallel peripherals varies significantly, the PMP module is highly configurable.

The following are key features of the PMP module:

- 8-bit,16-bit interface
- Up to 16 programmable address lines
- Up to two Chip Select lines
- Programmable strobe options:
  - Individual read and write strobes, or
  - Read/$\overline{\text{write}}$ strobe with enable strobe
- Address auto-increment/auto-decrement
- Programmable address/data multiplexing
- Programmable polarity on control signals
- Parallel Slave Port support:
  - Legacy addressable
  - Address support
  - 4-byte deep auto-incrementing buffer
- Programmable Wait states
- Operate during Sleep and Idle modes
- Separate configurable read/write registers or dual buffers for Master mode
- Fast bit manipulation using CLR, SET, and INV registers

Note: On 64-pin devices, data pins PMD<15:8> are not available in 16-bit Master modes.

bit 31-0 **CiFIFOBA<31:0>:** CAN FIFO Base Address bits

These bits define the base address of all message buffers. Individual message buffers are located based on the size of the previous message buffers. This address is a physical address. Note that bits <1:0> are read-only and read '0', forcing the messages to be 32-bit word-aligned in device RAM.

Note 1: This bit is unimplemented and will always read '0', which forces word-alignment of messages.

Note: This register can only be modified when the CAN module is in Configuration mode (OPMOD<2:0> (CiCON<23:21>) = 100).

bit 31-0 **CiFIFOUAn<31:0>:** CAN FIFO User Address bits

TXEN = 1: (FIFO configured as a Transmit Buffer)

A read of this register will return the address where the next message is to be written (FIFO head).

TXEN = 0: (FIFO configured as a Receive Buffer)

A read of this register will return the address where the next message is to be read (FIFO tail).

Note 1: This bit will always read '0', which forces byte-alignment of messages.

Note: This register is not guaranteed to read correctly in Configuration mode, and should only be accessed when the module is not in Configuration mode.

bit 4-0 **CiFIFOCIn<4:0>:** CAN Side FIFO Message Index bits

TXEN = 1: (FIFO configured as a Transmit Buffer)

A read of this register will return an index to the message that the FIFO will next attempt to transmit.

TXEN = 0: (FIFO configured as a Receive Buffer)

A read of this register will return an index to the message that the FIFO will use to save the next message.

bit 31-14 **Unimplemented:** Read as '0'

bit 13-8 **CWINDOW<5:0>:** Collision Window bits

This is a programmable field representing the slot time or collision window during which collisions occur in properly configured networks. Since the collision window starts at the beginning of transmission, the preamble and SFD is included. Its default of 0x37 (55d) corresponds to the count of frame bytes at the end of the window.

bit 7-4 **Unimplemented:** Read as '0'

bit 3-0 **RETX<3:0>:** Retransmission Maximum bits

This is a programmable field specifying the number of retransmission attempts following a collision before aborting the packet due to excessive collisions. The Standard specifies the maximum number of attempts (attemptLimit) to be 0xF (15d). Its default is '0xF'.

Note: Both 16-bit and 32-bit accesses are allowed to these registers (including the SET, CLR and INV registers). 8-bit accesses are not allowed and are ignored by the hardware.

39.0 252 MHz ELECTRICAL CHARACTERISTICS

This section provides an overview of the PIC32MZ EF electrical characteristics for devices running at 252 MHz. Additional information will be provided in future revisions of this document as it becomes available.

The specifications for 252 MHz are identical to those shown in **37.0 "Electrical Characteristics"** including absolute maximum ratings, with the exception of the parameters listed in this chapter.

Parameters in this chapter begin with the letter "M", which denotes 252 MHz operation. For example, parameter DC27a in **37.0 "Electrical Characteristics"**, is the up to 200 MHz operation equivalent for MDC27a.
