What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Active
Core Processor	MIPS32® M-Class
Core Size	32-Bit Single-Core
Speed	200MHz
Connectivity	EBI/EMI, Ethernet, I²C, PMP, SPI, SQI, UART/USART, USB OTG
Peripherals	Brown-out Detect/Reset, DMA, I²S, POR, PWM, WDT
Number of I/O	120
Program Memory Size	512KB (512K x 8)
Program Memory Type	FLASH
EEPROM Size	-
RAM Size	128K x 8
Voltage - Supply (Vcc/Vdd)	2.1V ~ 3.6V
Data Converters	A/D 48x12b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 85°C (TA)
Mounting Type	Surface Mount
Package / Case	144-TQFP
Supplier Device Package	144-TQFP (16x16)

TABLE 3-3: COPROCESSOR 0 REGISTERS (CONTINUED)

Register Number	Register Name	Function
12	Status	Processor status and control.
	IntCtl	Interrupt control of vector spacing.
	SRSCtl	Shadow register set control.
	SRSMap	Shadow register mapping control.
	View_IPL	Allows the Priority Level to be read/written without extracting or inserting that bit from/to the Status register.
	SRSMAP2	Contains two 4-bit fields that provide the mapping from a vector number to the shadow set number to use when servicing such an interrupt.
13	Cause	Describes the cause of the last exception.
	NestedExc	Contains the error and exception level status bit values that existed prior to the current exception.
	View_RIPL	Enables read access to the RIPL bit that is available in the Cause register.
14	EPC	Program counter at last exception.
	NestedEPC	Contains the exception program counter that existed prior to the current exception.
15	PRID	Processor identification and revision
	Ebase	Exception base address of exception vectors.
	CDMMBase	Common device memory map base.
16	Config	Configuration register.
	Config1	Configuration register 1.
	Config2	Configuration register 2.
	Config3	Configuration register 3.
	Config4	Configuration register 4.
	Config5	Configuration register 5.
	Config7	Configuration register 7.
17	LLAddr	Load link address (MPU only).
18	WatchLo	Low-order watchpoint address (MPU only).
19	WatchHi	High-order watchpoint address (MPU only).
20-22	Reserved	Reserved in the PIC32 core.
23	Debug	EJTAG debug register.
	TraceControl	EJTAG trace control.
	TraceControl2	EJTAG trace control 2.
	UserTraceData1	EJTAG user trace data 1 register.
	TraceBPC	EJTAG trace breakpoint register.
	Debug2	Debug control/exception status 1.
24	DEPC	Program counter at last debug exception.
	UserTraceData2	EJTAG user trace data 2 register.
25	PerfCtl0	Performance counter 0 control.
	PerfCnt0	Performance counter 0.
	PerfCtl1	Performance counter 1 control.
	PerfCnt1	Performance counter 1.
26	ErrCtl	Software test enable of way-select and data RAM arrays for I-Cache and D-Cache (MPU only).
27	Reserved	Reserved in the PIC32 core.
28	TagLo/DataLo	Low-order portion of cache tag interface (MPU only).
29	Reserved	Reserved in the PIC32 core.
30	ErrorEPC	Program counter at last error exception.
31	DeSave	Debug exception save.

bit 4 **SLPEN:** Sleep Mode Enable bit

1 = Device will enter Sleep mode when a WAIT instruction is executed
0 = Device will enter Idle mode when a WAIT instruction is executed

bit 3 **CF:** Clock Fail Detect bit

1 = FSCM has detected a clock failure
0 = No clock failure has been detected

bit 2 **Unimplemented:** Read as '0'

bit 1 **SOSCEN:** Secondary Oscillator (SOSC) Enable bit

1 = Enable Secondary Oscillator
0 = Disable Secondary Oscillator

bit 0 **OSWEN:** Oscillator Switch Enable bit**(1)**

1 = Initiate an oscillator switch to selection specified by NOSC<2:0> bits
0 = Oscillator switch is complete

Note 1: The reset value for this bit depends on the setting of the IESO bit (DEVCFG1<7>). When IESO = 1, the reset value is '1'. When IESO = 0, the reset value is '0'.

Note:	Writes to this register require an unlock sequence. Refer to **Section 42. "Oscillators with Enhanced PLL"** (DS60001250) in the *"PIC32 Family Reference Manual"* for details.

25.0 REAL-TIME CLOCK AND CALENDAR (RTCC)

Note: This data sheet summarizes the features of the PIC32MZ EF family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 29. "Real-Time Clock and Calendar (RTCC)"** (DS60001125) in the *"PIC32 Family Reference Manual"*, which is available from the Microchip web site (www.microchip.com/PIC32).

The RTCC module is intended for applications in which accurate time must be maintained for extended periods of time with minimal or no CPU intervention. Low-power optimization provides extended battery lifetime while keeping track of time.

The following are key features of the RTCC module:

- Time: hours, minutes, and seconds
- 24-hour format (military time)
- Visibility of one-half second period
- Provides calendar: Weekday, date, month and year
- Alarm intervals are configurable for half of a second, one second, 10 seconds, one minute, 10 minutes, one hour, one day, one week, one month, and one year
- Alarm repeat with decrementing counter
- Alarm with indefinite repeat: Chime
- Year range: 2000 to 2099
- Leap year correction
- BCD format for smaller firmware overhead
- Optimized for long-term battery operation
- Fractional second synchronization
- User calibration of the clock crystal frequency with auto-adjust
- Calibration range: ±0.66 seconds error per month
- Calibrates up to 260 ppm of crystal error
- Uses external 32.768 kHz crystal or 32 kHz internal oscillator
- Alarm pulse, seconds clock, or internal clock output on RTCC pin

33.0 POWER-SAVING FEATURES

Note: This data sheet summarizes the features of the PIC32MZ EF family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 10. "Power-Saving Features"** (DS60001130) in the *"PIC32 Family Reference Manual"*, which is available from the Microchip web site (www.microchip.com/PIC32).

This section describes power-saving features for the PIC32MZ EF devices. These devices offer various methods and modes that allow the user to balance power consumption with device performance. In all of the methods and modes described in this section, power-saving is controlled by software.

33.1 Power Saving with CPU Running

When the CPU is running, power consumption can be controlled by reducing the CPU clock frequency, lowering the speed of PBCLK7, or selecting a lower power clock source (i.e., LPRC or SOSC).

In addition, the Peripheral Bus Scaling mode is available for each peripheral bus where peripherals are clocked at reduced speed by selecting a higher divider for the associated PBCLKx, or by disabling the clock completely.

33.2 Power-Saving with CPU Halted

Peripherals and the CPU can be Halted or disabled to further reduce power consumption.

33.2.1 SLEEP MODE

Sleep mode has the lowest power consumption of the device power-saving operating modes. The CPU and most peripherals are Halted and the associated clocks are disabled. Select peripherals can continue to operate in Sleep mode and can be used to wake the device from Sleep. See the individual peripheral module sections for descriptions of behavior in Sleep.

Sleep mode includes the following characteristics:

- There can be a wake-up delay based on the oscillator selection
- The Fail-Safe Clock Monitor (FSCM) does not operate during Sleep mode
- The BOR circuit remains operative during Sleep mode
- The WDT, if enabled, is not automatically cleared prior to entering Sleep mode
- Some peripherals can continue to operate at limited functionality in Sleep mode. These peripherals include I/O pins that detect a change in the input signal, WDT, ADC, UART and peripherals that use an external clock input or the internal LPRC oscillator (e.g., RTCC, Timer1 and Input Capture).
- I/O pins continue to sink or source current in the same manner as they do when the device is not in Sleep

The processor will exit, or 'wake-up', from Sleep on one of the following events:

- On any interrupt from an enabled source that is operating in Sleep. The interrupt priority must be greater than the current CPU priority.
- On any form of device Reset
- On a WDT time-out

If the interrupt priority is lower than or equal to the current priority, the CPU will remain Halted, but the peripheral bus clocks will start running and the device will enter into Idle mode.

33.2.2 IDLE MODE

In Idle mode, the CPU is Halted; however, all clocks are still enabled. This allows peripherals to continue to operate. Peripherals can be individually configured to Halt when entering Idle by setting their respective SIDL bit. Latency, when exiting Idle mode, is very low due to the CPU oscillator source remaining active.

The device enters Idle mode when the SLPEN bit (OSCCON<4>) is clear and a `WAIT` instruction is executed.

The processor will wake or exit from Idle mode on the following events:

- On any interrupt event for which the interrupt source is enabled. The priority of the interrupt event must be greater than the current priority of the CPU. If the priority of the interrupt event is lower than or equal to current priority of the CPU, the CPU will remain Halted and the device will remain in Idle mode.
- On any form of device Reset
- On a WDT time-out interrupt

A.2 Analog-to-Digital Converter (ADC)

The PIC32MZ EF family of devices has a new 12-bit High-Speed Successive Approximation Register (SAR) ADC module that replaces the 10-bit ADC module in PIC32MX5XX/6XX/7XX devices; therefore, the use of **Bold** type to show differences is *not* used in the following table. Note that not all register differences are described in this section; however, the key feature differences are listed in Table A-3.

TABLE A-3: ADC DIFFERENCES

PIC32MX5XX/6XX/7XX Feature	PIC32MZ EF Feature
Clock Selection and Operating Frequency (TAD)	
On PIC32MX devices, the ADC clock was derived from either the FRC or from the PBCLK. ADRC (AD1CON3<15>) 1 = FRC clock 0 = Clock derived from Peripheral Bus Clock (PBCLK)	On PIC32MZ EF devices, the three possible sources of the ADC clock are FRC, REFCLKO3, and SYSCLK. ADCSEL<1:0> (ADCCON3<31:30>) 11 = FRC 10 = REFCLKO3 01 = SYSCLK 00 = Reserved
On PIC32MX devices, if the ADC clock was derived from the PBCLK, that frequency was divided further down, with a maximum divisor of 512, and a minimum divisor of two. The input clock can also be fed directly to the ADC. ADCDIV<6:0> (ADCTIMEx<22:16>) ADCDIV<6:0> (ADCCON2<6:0>) 1111111 = 254 * TQ = TAD • • • 0000011 = 6 * TQ = TAD 0000010 = 4 * TQ = TAD 0000001 = 2 * TQ = TAD 0000000 = TQ = TAD
