
Welcome to E-XFL.COM

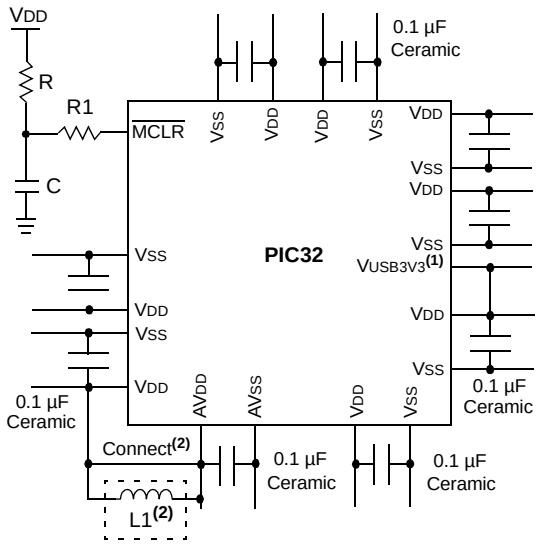
What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Obsolete
Core Processor	MIPS32® M-Class
Core Size	32-Bit Single-Core
Speed	180MHz
Connectivity	CANbus, EBI/EMI, Ethernet, I²C, PMP, SPI, SQI, UART/USART, USB OTG
Peripherals	Brown-out Detect/Reset, DMA, I²S, POR, PWM, WDT
Number of I/O	97
Program Memory Size	512KB (512K x 8)
Program Memory Type	FLASH
EEPROM Size	-
RAM Size	128K x 8
Voltage - Supply (Vcc/Vdd)	2.1V ~ 3.6V
Data Converters	A/D 48x12b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 125°C
Mounting Type	Surface Mount
Package / Case	124-VFTLA Dual Rows, Exposed Pad
Supplier Device Package	124-VTLA (9x9)
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/pic32mz0512eff124-e-tl

FIGURE 2-1: RECOMMENDED MINIMUM CONNECTION



Note 1: If the USB module is not used, this pin must be connected to VSS.

2: As an option, instead of a hard-wired connection, an inductor (L1) can be substituted between VDD and AVDD to improve ADC noise rejection. The inductor impedance should be less than 1Ω and the inductor capacity greater than 10 mA.

Where:

$$f = \frac{FCNV}{2} \quad \text{(i.e., ADC conversion rate/2)}$$

$$f = \frac{1}{(2\pi\sqrt{LC})}$$

$$L = \left(\frac{1}{(2\pi f\sqrt{C})}\right)^2$$

2.2.1 BULK CAPACITORS

The use of a bulk capacitor is recommended to improve power supply stability. Typical values range from 4.7 µF to 47 µF. This capacitor should be located as close to the device as possible.

2.3 Master Clear (MCLR) Pin

The MCLR pin provides for two specific device functions:

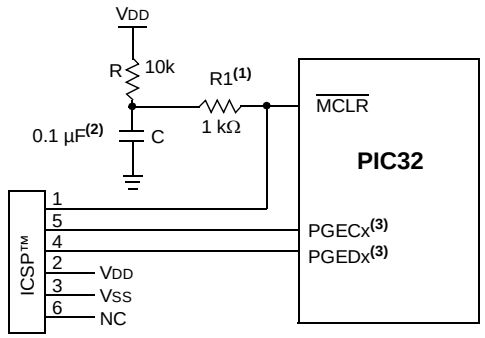
- Device Reset
- Device programming and debugging

Pulling The MCLR pin low generates either a device Reset or a POR, depending on the setting of the SMCLR bit (DEVCFG0<15>). Figure 2-2 illustrates a typical MCLR circuit. During device programming and debugging, the resistance and capacitance that can be added to the pin must be considered. Device programmers and debuggers drive the MCLR pin. Consequently, specific voltage levels (VIH and VIL) and fast signal transitions must not be adversely affected. Therefore, specific values of R and C will need to be adjusted based on the application and PCB requirements.

For example, as illustrated in Figure 2-2, it is recommended that the capacitor C be isolated from the MCLR pin during programming and debugging operations.

Place the components illustrated in Figure 2-2 within one-quarter inch (6 mm) from the MCLR pin.

FIGURE 2-2: EXAMPLE OF MCLR PIN CONNECTIONS



Note 1: 470Ω ≤ R1 ≤ 1kΩ will limit any current flowing into MCLR from the external capacitor C, in the event of MCLR pin breakdown, due to Electrostatic Discharge (ESD) or Electrical Overstress (EOS). Ensure that the MCLR pin VIH and VIL specifications are met without interfering with the Debug/Programmer tools.

2: The capacitor can be sized to prevent unintentional Resets from brief glitches or to extend the device Reset period during POR.

3: No pull-ups or bypass capacitors are allowed on active debug/program PGECx/PGEDx pins.

TABLE 4-20: SYSTEM BUS TARGET 12 REGISTER MAP

Virtual Address (BF8F_#)	Register Name	Bit Range	Bits																All Resets

		15:0	—	—	—	—	—	—	—	—	—	—	—	—	GROUP3	GROUP2	GROUP1	GROUP0	xxxx

Legend: x = unknown value on Reset; — = unimplemented, read as '0'. Reset values are shown in hexadecimal.
Note: For reset values listed as 'xxxx', please refer to Table 4-6 for the actual reset values.

6.0 RESETS

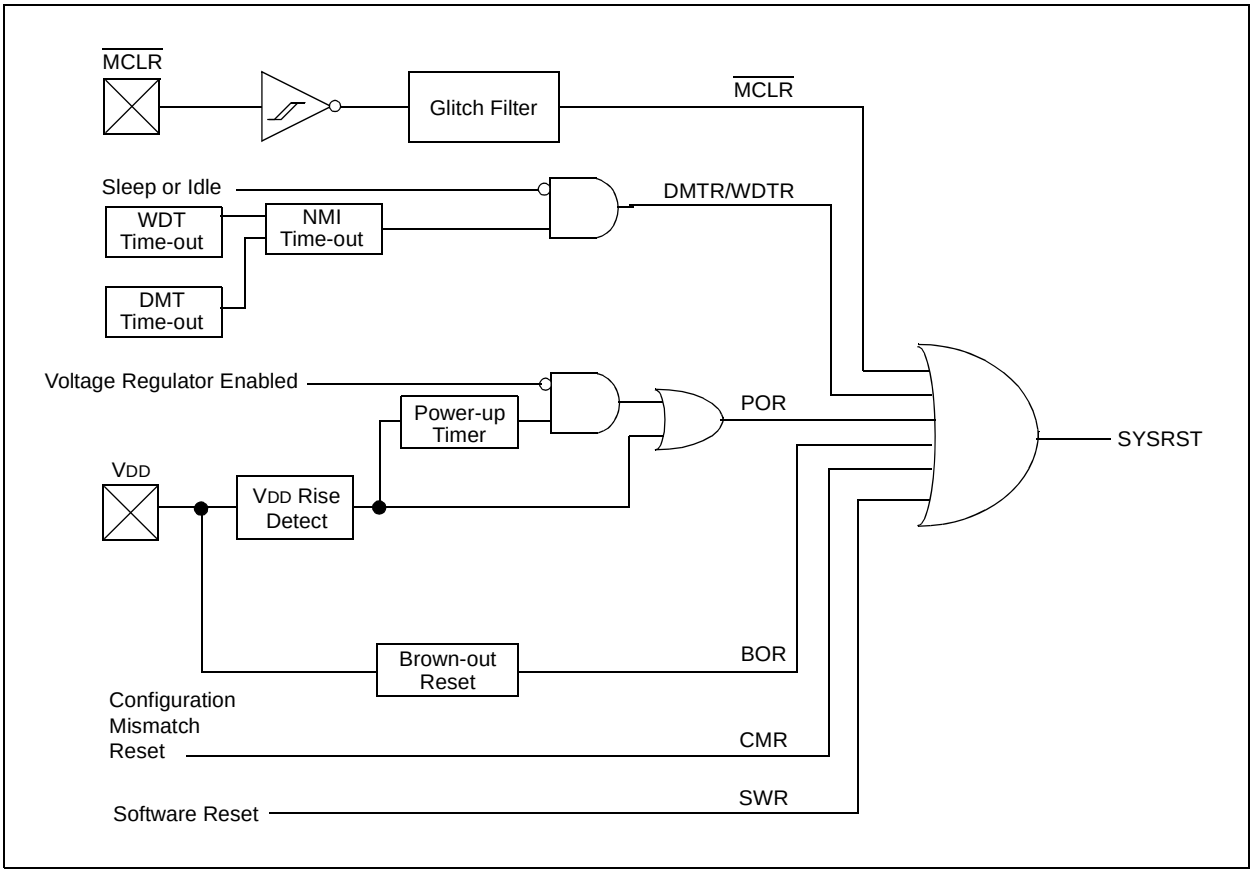
Note: This data sheet summarizes the features of the PIC32MZ EF family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 7. "Resets"** (DS60001118) in the *"PIC32 Family Reference Manual"*, which is available from the Microchip web site (www.microchip.com/PIC32).

The Reset module combines all Reset sources and controls the device Master Reset signal, SYSRST. The device Reset sources are as follows:

- Power-on Reset (POR)
- Master Clear Reset pin ($\overline{\text{MCLR}}$)
- Software Reset (SWR)
- Watchdog Timer Reset (WDTR)
- Brown-out Reset (BOR)
- Configuration Mismatch Reset (CMR)
- Deadman Timer Reset (DMTR)

A simplified block diagram of the Reset module is illustrated in Figure 6-1.

FIGURE 6-1: SYSTEM RESET BLOCK DIAGRAM



NOTES:

REGISTER 11-9: USBIENCSR1: USB INDEXED ENDPOINT CONTROL STATUS REGISTER 1 (ENDPOINT 1-7) (CONTINUED)

bit 18 **OVERRUN:** Data Overrun Status bit (*Device mode*)

1 = An OUT packet cannot be loaded into the RX FIFO.
0 = Written by software to clear this bit

This bit is only valid when the endpoint is operating in ISO mode. In Bulk mode, it always returns zero.

ERROR: No Data Packet Received Status bit (*Host mode*)

1 = Three attempts have been made to receive a packet and no data packet has been received. An interrupt is generated.

0 = Written by the software to clear this bit.

This bit is only valid when the RX endpoint is operating in Bulk or Interrupt mode. In ISO mode, it always returns zero.

bit 17 **FIFOFULL:** FIFO Full Status bit

1 = No more packets can be loaded into the RX FIFO
0 = The RX FIFO has at least one free space

bit 16 **RXPKTRDY:** Data Packet Reception Status bit

1 = A data packet has been received. An interrupt is generated.
0 = Written by software to clear this bit when the packet has been unloaded from the RX FIFO.

bit 15-11 **MULT<4:0>:** Multiplier Control bits

For Isochronous/Interrupt endpoints or of packet splitting on Bulk endpoints, multiplies TXMAXP by MULT+1 for the payload size.

For Bulk endpoints, MULT can be up to 32 and defines the number of “USB” packets of the specified payload into which a single data packet placed in the FIFO should be split, prior to transfer. The data packet is required to be an exact multiple of the payload specified by TXMAXP.

For Isochronous/Interrupts endpoints operating in Hi-Speed mode, MULT may be either 2 or 3 and specifies the maximum number of such transactions that can take place in a single microframe.

bit 10-0 **RXMAXP<10:0>:** Maximum RX Payload Per Transaction Control bits

This field sets the maximum payload (in bytes) transmitted in a single transaction. The value is subject to the constraints placed by the USB Specification on packet sizes for Bulk, Interrupt and Isochronous transfers in Full-Speed and Hi-Speed operations.

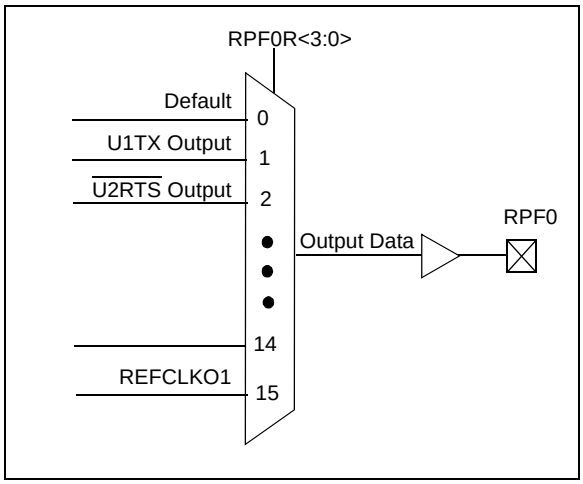
RXMAXP must be set to an even number of bytes for proper interrupt generation in DMA Mode 1.

12.4.5 OUTPUT MAPPING

In contrast to inputs, the outputs of the PPS options are mapped on the basis of the pin. In this case, a control register associated with a particular pin dictates the peripheral output to be mapped. The RPnR registers (Register 12-2) are used to control output mapping. Like the [*pin name*]R registers, each register contains sets of 4 bit fields. The value of the bit field corresponds to one of the peripherals, and that peripheral's output is mapped to the pin (see Table 12-3 and Figure 12-3).

A null output is associated with the output register reset value of '0'. This is done to ensure that remappable outputs remain disconnected from all output pins by default.

FIGURE 12-3: EXAMPLE OF MULTIPLEXING OF REMAPPABLE OUTPUT FOR RPF0



12.4.6 CONTROLLING CONFIGURATION CHANGES

Because peripheral remapping can be changed during run time, some restrictions on peripheral remapping are needed to prevent accidental configuration changes. PIC32MZ EF devices include two features to prevent alterations to the peripheral map:

- Control register lock sequence
- Configuration bit select lock

12.4.6.1 Control Register Lock

Under normal operation, writes to the RPnR and [*pin name*]R registers are not allowed. Attempted writes appear to execute normally, but the contents of the registers remain unchanged. To change these registers, they must be unlocked in hardware. The register lock is controlled by the IOLOCK Configuration bit (CFGCON<13>). Setting IOLOCK prevents writes to the control registers; clearing IOLOCK allows writes.

To set or clear the IOLOCK bit, an unlock sequence must be executed. Refer to **Section 42. "Oscillators with Enhanced PLL"** in the *"PIC32 Family Reference Manual"* for details.

12.4.6.2 Configuration Bit Select Lock

As an additional level of safety, the device can be configured to prevent more than one write session to the RPnR and [*pin name*]R registers. The IOL1WAY Configuration bit (DEVCFG3<29>) blocks the IOLOCK bit from being cleared after it has been set once. If IOLOCK remains set, the register unlock procedure does not execute, and the PPS control registers cannot be written to. The only way to clear the bit and re-enable peripheral remapping is to perform a device Reset.

In the default (unprogrammed) state, IOL1WAY is set, restricting users to one write session.

	—	—	—	RXCMDTHR<4:0>(1)				

Legend:			
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31-13 **Unimplemented:** Read as '0'

bit 12-8 **TXCMDTHR<4:0>:** Transmit Command Threshold bits

In transmit initiation mode, the SQI module performs a transmit operation when transmit command threshold bytes are present in the TX FIFO. These bits should usually be set to '1' for normal Flash commands, and set to a higher value for page programming. For 16-bit mode, the value should be a multiple of 2.

bit 7-5 **Unimplemented:** Read as '0'

bit 4-0 **RXCMDTHR<4:0>:** Receive Command Threshold bits(1)

In receive initiation mode, the SQI module attempts to perform receive operations to fetch the receive command threshold number of bytes in the receive buffer. If space for these bytes is not present in the FIFO, the SQI will not initiate a transfer. For 16-bit mode, the value should be a multiple of 2.

If software performs any reads, thereby reducing the FIFO count, hardware would initiate a receive transfer to make the FIFO count equal to the value in these bits. If software would not like any more words latched into the FIFO, command initiation mode needs to be changed to Idle before any FIFO reads by software.

In the case of Boot/XIP mode, the SQI module will use the System Bus burst size, instead of the receive command threshold value.

Note 1: These bits should only be programmed when a receive is not active (i.e., during Idle mode or a transmit).

REGISTER 28-2: ADCCON2: ADC CONTROL REGISTER 2 (CONTINUED)

bit 14 **REFFLTIEN:** Band Gap/VREF Voltage Fault Interrupt Enable bit

1 = Interrupt will be generated when the REFFLT bit is set
0 = No interrupt is generated when the REFFLT bit is set

bit 13 **EOSIEN:** End of Scan Interrupt Enable bit

1 = Interrupt will be generated when EOSRDY bit is set
0 = No interrupt is generated when the EOSRDY bit is set

bit 12 **ADCEIOVR:** Early Interrupt Request Override bit

1 = Early interrupt generation is not overridden and interrupt generation is controlled by the ADCEIEN1 and ADCEIEN2 registers
0 = Early interrupt generation is overridden and interrupt generation is controlled by the ADCGIRQEN1 and ADCGIRQEN2 registers

bit 11 **Unimplemented:** Read as '0'

bit 10-8 **ADCEIS<2:0>:** Shared ADC (ADC7) Early Interrupt Select bits

These bits select the number of clocks (TAD7) prior to the arrival of valid data that the associated interrupt is generated.

111 = The data ready interrupt is generated 8 ADC clocks prior to end of conversion
110 = The data ready interrupt is generated 7 ADC clocks prior to end of conversion
•
•
•
001 = The data ready interrupt is generated 2 ADC module clocks prior to end of conversion
000 = The data ready interrupt is generated 1 ADC module clock prior to end of conversion

Note: All options are available when the selected resolution, set by the SELRES<1:0> bits (ADCCON1<22:21>), is 12-bit or 10-bit. For a selected resolution of 8-bit, options from '000' to '101' are valid. For a selected resolution of 6-bit, options from '000' to '011' are valid.

bit 7 **Unimplemented:** Read as '0'

bit 6-0 **ADCDIV<6:0>:** Shared ADC (ADC7) Clock Divider bits

1111111 = 254 * TQ = TAD7
•
•
•
0000011 = 6 * TQ = TAD7
0000010 = 4 * TQ = TAD7
0000001 = 2 * TQ = TAD7
0000000 = Reserved

The ADCDIV<6:0> bits divide the ADC control clock (TQ) to generate the clock for the Shared ADC, ADC7 (TAD7).

A.3 CPU

The CPU in the PIC32MZ EF family of devices has been changed to the MIPS32 M-Class MPU architecture. This CPU includes DSP ASE, internal data and instruction L1 caches, and a TLB-based MMU.

Table A-4 summarizes some of the key differences (indicated by **Bold** type) in the internal CPU registers.

TABLE A-4: CPU DIFFERENCES

PIC32MX5XX/6XX/7XX Feature	PIC32MZ EF Feature
L1 Data and Instruction Cache and Prefetch Wait States	
On PIC32MX devices, the cache was included in the prefetch module outside the CPU. PREFEN<1:0> (**CHECON**<5:4>) **11 = Enable predictive prefetch for both cacheable and non-cacheable regions** **10 = Enable predictive prefetch for non-cacheable regions only** **01 = Enable predictive prefetch for cacheable regions only** 00 = Disable predictive prefetch DCSZ<1:0> (CHECON<9:8>) Changing these bits causes all lines to be reinitialized to the "invalid" state. 11 = Enable data caching with a size of 4 lines 10 = Enable data caching with a size of 2 lines 01 = Enable data caching with a size of 1 line 00 = Disable data caching CHECOH (CHECON<16>) 1 = Invalidate all data and instruction lines 0 = Invalidate all data and instruction lines that are not locked	On PIC32MZ EF devices, the CPU has a separate L1 instruction and data cache in the core. The PREFEN<1:0> bits still enable the prefetch module; however, the K0<2:0> bits in the CP0 registers controls the internal L1 cache for the designated regions. PREFEN<1:0> (**PRECON**<5:4>) **11 = Enable predictive prefetch for any address** **10 = Enable predictive prefetch for CPU instructions and CPU data** **01 = Enable predictive prefetch for CPU instructions only** 00 = Disable predictive prefetch **K0<2:0> (CP0 Reg 16, Select 0)** **011 = Cacheable, non-coherent, write-back, write allocate** **010 = Uncached** **001 = Cacheable, non-coherent, write-through, write allocate** **000 = Cacheable, non-coherent, write-through, no write allocate**
PFMWS<2:0> (**CHECON**<2:0>) 111 = Seven Wait states 110 = Six Wait states 101 = Five Wait states 100 = Four Wait states 011 = Three Wait states 010 = Two Wait states **(61-80 MHz)** 001 = One Wait state **(31-60 MHz)** 000 = Zero Wait state **(0-30 MHz)**	The Program Flash Memory read wait state frequency points have changed in PIC32MZ EF devices. The register for accessing the PFMWS field has changed from CHECON to PRECON. PFMWS<2:0> (**PRECON**<2:0>) 111 = Seven Wait states • • • 100 = Four Wait states **(200-252 MHz)** 011 = Reserved 010 = Two Wait states **(133-200 MHz)** 001 = One Wait state **(66-133 MHz)** 000 = Zero Wait states **(0-66 MHz)** **Note:** Wait states listed are for ECC enabled.
Core Instruction Execution	
On PIC32MX devices, the CPU can execute MIPS16e instructions and uses a 16-bit instruction set, which reduces memory size. **MIPS16e®**	On PIC32MZ EF devices, the CPU can operate a mode called microMIPS. microMIPS mode is an enhanced MIPS32® instruction set that uses both 16-bit and 32-bit opcodes. This mode of operation reduces memory size with minimum performance impact. **microMIPS™** The BOOTISA (DEVCFG0<6>) Configuration bit controls the MIPS32 and microMIPS modes for boot and exception code. 1 = Boot code and Exception code is MIPS32® (ISAONEXC bit is set to '0' and the ISA<1:0> bits are set to '10' in the CP0 Config3 register) 0 = Boot code and Exception code is microMIPS™ (ISAONEXC bit is set to '1' and the ISA<1:0> bits are set to '11' in the CP0 Config3 register)

A.10 Package Differences

In general, PIC32MZ EF devices are mostly pin compatible with PIC32MX5XX/6XX/7XX devices; however, some pins are not. In particular, the VDD and VSS pins have been added and moved to different pins. In addition, I/O functions that were on fixed pins now will largely be on remappable pins.

TABLE A-11: PACKAGE DIFFERENCES

PIC32MX5XX/6XX/7XX Feature	PIC32MZ EF Feature
VCAP Pin	
On PIC32MX devices, an external capacitor is required between a VCAP pin and GND, which provides a filtering capacitor for the internal voltage regulator.	On PIC32MZ EF devices, this requirement has been removed.
A low-ESR capacitor (typically 10 µF) is required on the VCAP pin.	No VCAP pin.
VDD and VSS Pins	
	There are more VDD pins on PIC32MZ EF devices, and many are located on different pins.
VDD on 64-pin packages: 10, 26, 38, 57 VDD on 100-pin packages: 2, 16, 37, 46, 62, 86	VDD on 64-pin packages: 8, 26, 39, 54, 60 VDD on 100-pin packages: 14, 37, 46, 62, 74, 83, 93
	There are more VSS pins on PIC32MZ EF devices, and many are located on different pins.
VSS on 64-pin packages: 9, 25, 41 VSS on 100-pin packages: 15, 36, 45, 65, 75	VSS on 64-pin packages: 7, 25, 35, 40, 55, 59 VSS on 100-pin packages: 13, 36, 45, 53, 63, 75, 84, 92
PPS I/O Pins	
	Peripheral functions on PIC32MZ EF devices are now routed through a PPS module, which routes the signals to the desired pins. When migrating software, it is necessary to initialize the PPS I/O functions in order to get the signal to and from the correct pin.
All peripheral functions are fixed as to what pin upon which they operate.	PPS functionality for the following peripherals: • CAN • UART • SPI (except SCK) • Input Capture • Output Compare • External Interrupt (except INT0) • Timer Clocks (except Timer1) • Reference Clocks (except REFCLK2)
