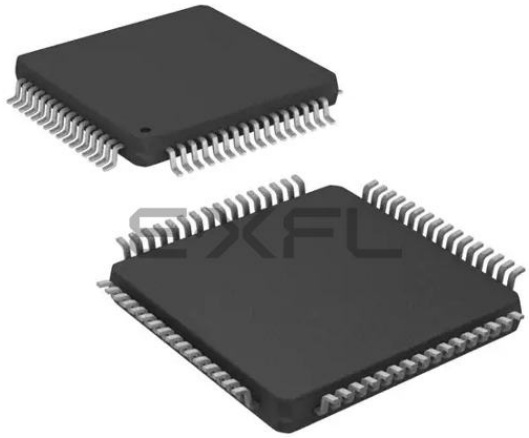
Microchip Technology - PIC32MZ1024EFE064T-I/PT Datasheet



Welcome to E-XFL.COM

What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Active
Core Processor	MIPS32® M-Class
Core Size	32-Bit Single-Core
Speed	200MHz
Connectivity	Ethernet, I²C, PMP, SPI, SQI, UART/USART, USB OTG
Peripherals	Brown-out Detect/Reset, DMA, I²S, POR, PWM, WDT
Number of I/O	46
Program Memory Size	1MB (1M x 8)
Program Memory Type	FLASH
EEPROM Size	-
RAM Size	256K x 8
Voltage - Supply (Vcc/Vdd)	2.1V ~ 3.6V
Data Converters	A/D 24x12b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 85°C (TA)
Mounting Type	Surface Mount
Package / Case	64-TQFP
Supplier Device Package	64-TQFP (10x10)
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/pic32mz1024efe064t-i-pt

TABLE 1-6: PORTA THROUGH PORTK PINOUT I/O DESCRIPTIONS (CONTINUED)

Pin Name	Pin Number				Pin Type	Buffer Type	Description
	64-pin QFN/ TQFP	100-pin TQFP	124-pin VTLA	144-pin TQFP/ LQFP			
PORTK							
RK0	—	—	—	19	I/O	ST	PORTK is a bidirectional I/O port
RK1	—	—	—	51	I/O	ST	
RK2	—	—	—	52	I/O	ST	
RK3	—	—	—	53	I/O	ST	
RK4	—	—	—	92	I/O	ST	
RK5	—	—	—	93	I/O	ST	
RK6	—	—	—	94	I/O	ST	
RK7	—	—	—	126	I/O	ST

TABLE 1-7: TIMER1 THROUGH TIMER9 AND RTCC PINOUT I/O DESCRIPTIONS

Pin Name	Pin Number				Pin Type	Buffer Type	Description
	64-pin QFN/ TQFP	100-pin TQFP	124-pin VTLA	144-pin TQFP/ LQFP			
Timer1 through Timer9							
T1CK	48	73	A49	106	I	ST	Timer1 External Clock Input
T2CK	PPS	PPS	PPS	PPS	I	ST	Timer2 External Clock Input
T3CK	PPS	PPS	PPS	PPS	I	ST	Timer3 External Clock Input
T4CK	PPS	PPS	PPS	PPS	I	ST	Timer4 External Clock Input
T5CK	PPS	PPS	PPS	PPS	I	ST	Timer5 External Clock Input
T6CK	PPS	PPS	PPS	PPS	I	ST	Timer6 External Clock Input
T7CK	PPS	PPS	PPS	PPS	I	ST	Timer7 External Clock Input
T8CK	PPS	PPS	PPS	PPS	I	ST	Timer8 External Clock Input
T9CK	PPS	PPS	PPS	PPS	I	ST	Timer9 External Clock Input
Real-Time Clock and Calendar							
RTCC	46	71	A48	104	O	—	Real-Time Clock Alarm/Seconds Output

Legend: CMOS = CMOS-compatible input or output; Analog = Analog input; P = Power
ST = Schmitt Trigger input with CMOS levels; O = Output; I = Input
TTL = Transistor-transistor Logic input buffer; PPS = Peripheral Pin Select

3.0 CPU

Note 1: This data sheet summarizes the features of the PIC32MZ EF family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 50. "CPU for Devices with MIPS32® microAptiv™ and M-Class Cores"** (DS60001192) of the *"PIC32 Family Reference Manual"*, which is available from the Microchip web site (www.microchip.com/PIC32).

2: The Series 5 Warrior M-class CPU core resources are available at: www.imgtec.com.

The MIPS32® M-Class Core is the heart of the PIC32MZ EF family device processor. The CPU fetches instructions, decodes each instruction, fetches source operands, executes each instruction and writes the results of instruction execution to the proper destinations.

Key features include:

- 5-stage pipeline
- 32-bit address and data paths
- MIPS32 Enhanced Architecture (Release 5):
  - Multiply-accumulate and multiply-subtract instructions
  - Targeted multiply instruction
  - Zero/One detect instructions
  - `WAIT` instruction
  - Conditional move instructions (`MOVN`, `MOVZ`)
  - Vectored interrupts
  - Programmable exception vector base
  - Atomic interrupt enable/disable
  - GPR shadow registers to minimize latency for interrupt handlers
  - Bit field manipulation instructions
  - Virtual memory support
- microMIPS™ compatible instruction set:
  - Improves code size density over MIPS32, while maintaining MIPS32 performance.
  - Supports all MIPS32 instructions (except branch-likely instructions)
  - Fifteen additional 32-bit instructions and 39 16-bit instructions corresponding to commonly-used MIPS32 instructions
  - Stack pointer implicit in instruction
  - MIPS32 assembly and ABI compatible
- MMU with Translation Lookaside Buffer (TLB) mechanism:
  - 16 dual-entry fully associative Joint TLB
  - 4-entry fully associative Instruction and Data TLB
  - 4 KB pages
- Separate L1 data and instruction caches:
  - 16 KB 4-way Instruction Cache (I-Cache)
  - 4 KB 4-way Data Cache (D-Cache)
- Autonomous Multiply/Divide Unit (MDU):
  - Maximum issue rate of one 32x32 multiply per clock
  - Early-in iterative divide. Minimum 12 and maximum 38 clock latency (dividend (*rs*) sign extension-dependent)
- Power Control:
  - Minimum frequency: 0 MHz
  - Low-Power mode (triggered by `WAIT` instruction)
  - Extensive use of local gated clocks
- EJTAG Debug and Instruction Trace:
  - Support for single stepping
  - Virtual instruction and data address/value breakpoints
  - Hardware breakpoint supports both address match and address range triggering.
  - Eight instruction and four data complex breakpoints
- iFlowtrace® version 2.0 support:
  - Real-time instruction program counter
  - Special events trace capability
  - Two performance counters with 34 user-selectable countable events
  - Disabled if the processor enters Debug mode
  - Program Counter sampling
- Four Watch registers:
  - Instruction, Data Read, Data Write options
  - Address match masking options
- DSP ASE Extension:
  - Native fractional format data type operations
  - Register Single Instruction Multiple Data (SIMD) operations (add, subtract, multiply, shift)
  - GPR-based shift
  - Bit manipulation
  - Compare-Pick
  - DSP Control Access
  - Indexed-Load
  - Branch
  - Multiplication of complex operands
  - Variable bit insertion and extraction
  - Virtual circular buffers
  - Arithmetic saturation and overflow handling
  - Zero-cycle overhead saturation and rounding operations
- Floating Point Unit (FPU):
  - 1985 IEEE-754 compliant Floating Point Unit
  - Supports single and double precision datatypes
  - 2008 IEEE-754 compatibility control of NaN handling and Abs/Neg instructions
  - Runs at 1:1 core/FPU clock ratio

The FPU implements a high-performance 7-stage pipeline:

- Decode, register read and unpack (FR stage)
- Multiply tree, double pumped for double (M1 stage)
- Multiply complete (M2 stage)
- Addition first step (A1 stage)
- Addition second and final step (A2 stage)
- Packing to IEEE format (FP stage)
- Register writeback (FW stage)

The FPU implements a bypass mechanism that allows the result of an operation to be forwarded directly to the instruction that needs it without having to write the result to the FPU register and then read it back.

Table 3-5 lists the Coprocessor 1 Registers for the FPU.

TABLE 3-5: FPU (CP1) REGISTERS

Register Number	Register Name	Function
0	FIR	Floating Point implementation register. Contains information that identifies the FPU.
25	FCCR	Floating Point condition codes register.
26	FEXR	Floating Point exceptions register.
28	FENR	Floating Point enables register.
31	FCSR	Floating Point Control and Status register.

3.2 Power Management

The processor core offers a number of power management features, including low-power design, active power management and power-down modes of operation. The core is a static design that supports slowing or halting the clocks, which reduces system power consumption during Idle periods.

3.2.1 INSTRUCTION-CONTROLLED POWER MANAGEMENT

The mechanism for invoking Power-Down mode is through execution of the `WAIT` instruction. For more information on power management, see **Section 33.0 "Power-Saving Features"**.

3.2.2 LOCAL CLOCK GATING

The majority of the power consumed by the processor core is in the clock tree and clocking registers. The PIC32MZ family makes extensive use of local gated-clocks to reduce this dynamic power consumption.

3.3 L1 Instruction and Data Caches

3.3.1 INSTRUCTION CACHE (I-CACHE)

The I-Cache is an on-core memory block of 16 Kbytes. Because the I-Cache is virtually indexed, the virtual-to-physical address translation occurs in parallel with the cache access rather than having to wait for the physical address translation. The tag holds 22 bits of physical address, a valid bit, and a lock bit. The LRU replacement bits are stored in a separate array.

The I-Cache block also contains and manages the instruction line fill buffer. Besides accumulating data to be written to the cache, instruction fetches that reference data in the line fill buffer are serviced either by a bypass of that data, or data coming from the external interface. The I-Cache control logic controls the bypass function.

The processor core supports I-Cache locking. Cache locking allows critical code or data segments to be locked into the cache on a per-line basis, enabling the system programmer to maximize the efficiency of the system cache.

The cache locking function is always available on all I-Cache entries. Entries can then be marked as locked or unlocked on a per entry basis using the `CACHE` instruction.

3.3.2 DATA CACHE (D-CACHE)

The D-Cache is an on-core memory block of 4 Kbytes. This virtually indexed, physically tagged cache is protected. Because the D-Cache is virtually indexed, the virtual-to-physical address translation occurs in parallel with the cache access. The tag holds 22 bits of physical address, a valid bit, and a lock bit. There is an additional array holding dirty bits and LRU replacement algorithm bits for each set of the cache.

In addition to I-Cache locking, the processor core also supports a D-Cache locking mechanism identical to the I-Cache. Critical data segments are locked into the cache on a per-line basis. The locked contents can be updated on a store hit, but cannot be selected for replacement on a cache miss.

The D-Cache locking function is always available on all D-Cache entries. Entries can then be marked as locked or unlocked on a per-entry basis using the `CACHE` instruction.

3.3.3 ATTRIBUTES

The processor core I-Cache and D-Cache attributes are listed in the Configuration registers (see Register 3-1 through Register 3-4).

3.4 EJTAG Debug Support

The processor core provides for an Enhanced JTAG (EJTAG) interface for use in the software debug of application and kernel code. In addition to standard User mode and Kernel modes of operation, the processor core provides a Debug mode that is entered after a debug exception (derived from a hardware breakpoint, single-step exception, etc.) is taken and continues until a Debug Exception Return (DERET) instruction is executed. During this time, the processor executes the debug exception handler routine.

The EJTAG interface operates through the Test Access Port (TAP), a serial communication port used for transferring test data in and out of the core. In addition to the standard JTAG instructions, special instructions defined in the EJTAG specification specify which registers are selected and how they are used.

3.5 MIPS DSP ASE Extension

The MIPS DSP Application-Specific Extension Revision 2 is an extension to the MIPS32 architecture. This extension comprises new integer instructions and states that include new HI/LO accumulator register pairs and a DSP control register. This extension is crucial in a wide range of DSP, multimedia, and DSP-like algorithms covering Audio and Video processing applications. The extension supports native fractional format data type operations, register Single Instruction Multiple Data (SIMD) operations, such as add, subtract, multiply, and shift. In addition, the extension includes the following features that are essential in making DSP algorithms computationally efficient:

- Support for multiplication of complex operands
- Variable bit insertion and extraction
- Implementation and use of virtual circular buffers
- Arithmetic saturation and overflow handling support
- Zero cycle overhead saturation and rounding operations

3.6 microMIPS ISA

The processor core supports the microMIPS ISA, which contains all MIPS32 ISA instructions (except for branch-likely instructions) in a new 32-bit encoding scheme, with some of the commonly used instructions also available in 16-bit encoded format. This ISA improves code density through the additional 16-bit instructions while maintaining a performance similar to MIPS32 mode. In microMIPS mode, 16-bit or 32-bit instructions will be fetched and recoded to legacy MIPS32 instruction opcodes in the pipeline's I stage, so that the processor core can have the same microAptiv UP microarchitecture. Because the microMIPS instruction stream can be intermixed with 16-bit halfword or 32-bit word size instructions on halfword or word boundaries, additional logic is in place to address the word misalignment issues, thus minimizing performance loss.

REGISTER 4-3: SBTxELOG1: SYSTEM BUS TARGET 'x' ERROR LOG REGISTER 1 ('x' = 0-13)

-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31-16 **Unimplemented:** Read as '0'

bit 15-0 **FRMTXOKCNT<15:0>:** Frame Transmitted OK Count bits
Increment counter for frames successfully transmitted.

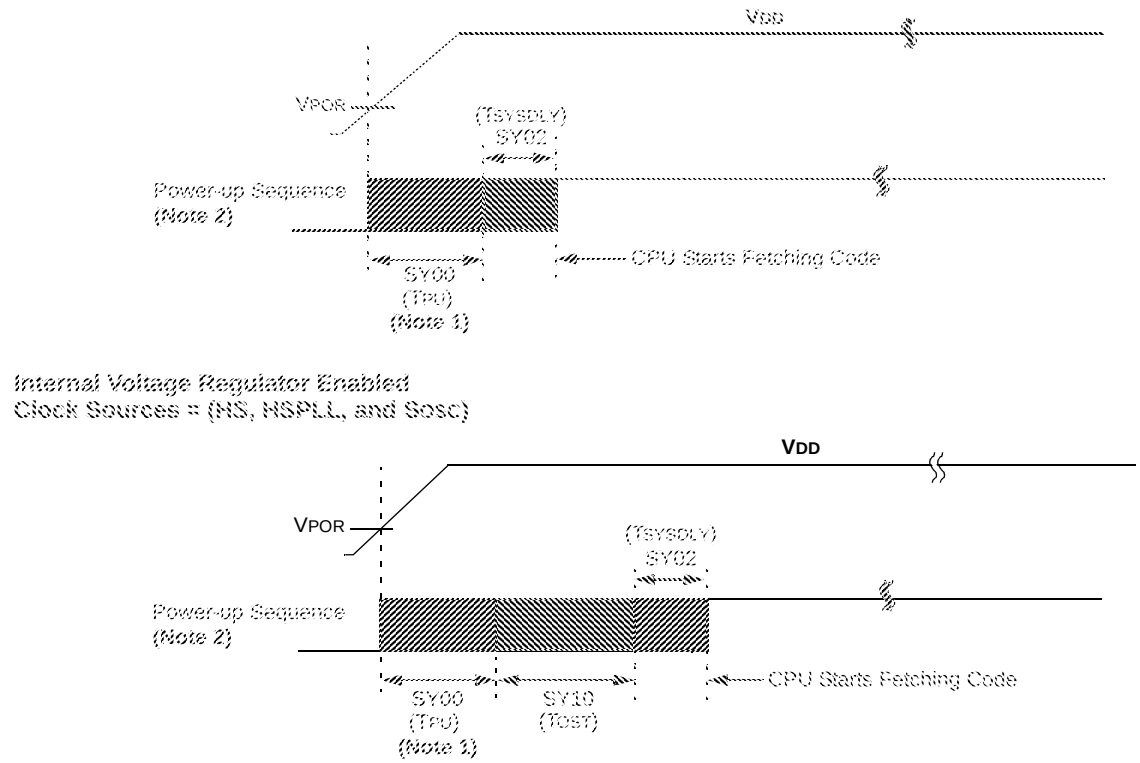
Note 1: This register is only used for TX operations.

2: This register is automatically cleared by hardware after a read operation, unless the byte enables for bytes 0/1 are '0'.

3: It is recommended to use the SET, CLR, or INV registers to set or clear any bit in this register. Setting or clearing any bits in this register should only be done for debug/test purposes.

NOTES:

FIGURE 37-4: POWER-ON RESET TIMING CHARACTERISTICS

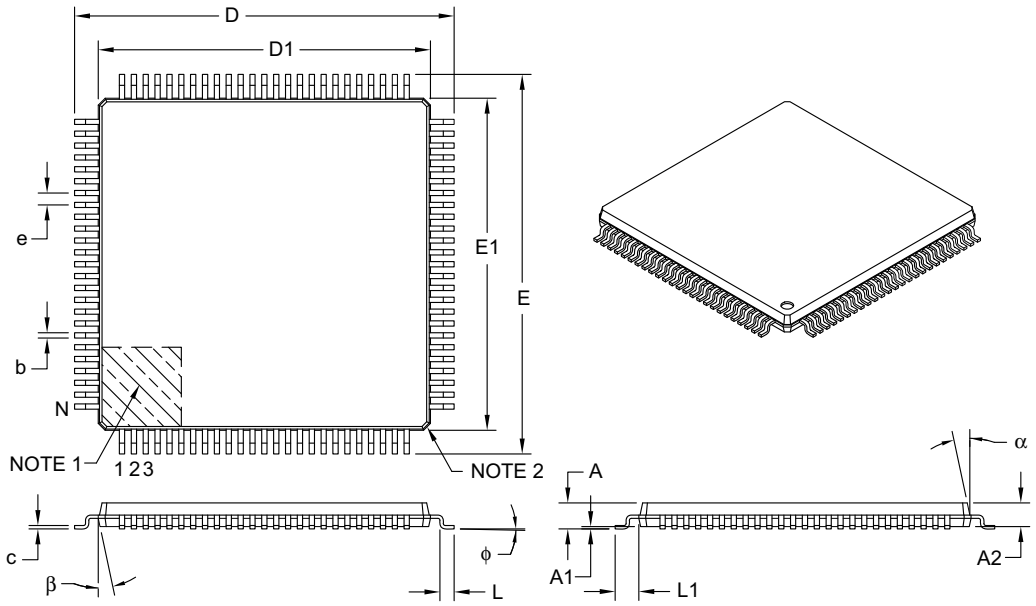


Note 1: The power-up period will be extended if the power-up sequence completes before the device exits from BOR ($V_{DD} < V_{DDMIN}$).

2: Includes interval voltage regulator stabilization delay.

100-Lead Plastic Thin Quad Flatpack (PF) – 14x14x1 mm Body, 2.00 mm [TQFP]

Note: For the most current package drawings, please see the Microchip Packaging Specification located at http://www.microchip.com/packaging



Units		MILLIMETERS		
Dimension Limits		MIN	NOM	MAX
Number of Leads	N		100	
Lead Pitch	e		0.50 BSC	
Overall Height	A	–	–	1.20
Molded Package Thickness	A2	0.95	1.00	1.05
Standoff	A1	0.05	–	0.15
Foot Length	L	0.45	0.60	0.75
Footprint	L1		1.00 REF	
Foot Angle	ϕ	0°	3.5°	7°
Overall Width	E		16.00 BSC	
Overall Length	D		16.00 BSC	
Molded Package Width	E1		14.00 BSC	
Molded Package Length	D1		14.00 BSC	
Lead Thickness	c	0.09	–	0.20
Lead Width	b	0.17	0.22	0.27
Mold Draft Angle Top	α	11°	12°	13°
Mold Draft Angle Bottom	β	11°	12°	13°

Notes:

1. Pin 1 visual index feature may vary, but must be located within the hatched area.
2. Chamfers at corners are optional; size may vary.
3. Dimensions D1 and E1 do not include mold flash or protrusions. Mold flash or protrusions shall not exceed 0.25 mm per side.
4. Dimensioning and tolerancing per ASME Y14.5M.

BSC: Basic Dimension. Theoretically exact value shown without tolerances.
REF: Reference Dimension, usually without tolerance, for information purposes only.

Microchip Technology Drawing C04-110B

B.10 Serial Quad Interface (SQI)

On PIC32MZ EF devices, the SQI module has been updated with the following features:

- FIFOs can be reset through the CONFIFORST (SQI1CFG<19>), RXFIFORST (SQI1CFG<18>), and TXFIFORST (SQI1CFG<17>) bits in Register 20-3
- A new Flash Status check is available, which will allow the SQI to automatically query the status of the external device during write/erase operations without software intervention. See the SCHECK bit (SQI1CON<24>) and the SQI1MEMSTAT register (Register 20-4 and Register 20-24, respectively).
- The SQI clock divider bits have been expanded, and can use an undivided clock. See the CLKDIV<10:0> bits (SQI1CLKCON<18:8>) in Register 20-5.
- A new DMA Bus Error Interrupt is available through the DMAEIE (SQI1INTEN<11>), DMAEIF (SQI1INTSTAT<11>), and DMAEISE (SQI1INTSIGEN<11>) bits in Register 20-8, Register 20-9, and Register 20-22, respectively
- The SQI1STAT2 register (see Register 20-13) has two new fields:
  - CMDSTAT<1:0> (SQI1STAT2<17:16>) indicates the current command status
  - CONAVAIL<4:0> (SQI1STAT<11:8>) indicates how many spaces are available in the Control FIFO.
- The TAP Controller within the SQI can be configured for various timing requirements via the SQI1TAPCON register (Register 20-23)
- Two new XIP mode registers (SQI1XCON3 and SQI1XCON4) have been added for additional command sequencing (see Register 20-25 and Register 20-26, respectively)

Refer to **20.0 “Serial Quad Interface (SQI)”** and **Section 46. “Serial Quad Interface (SQI)”** (DS60001128) for more information.

B.11 PMP

On PIC32MZ EF devices, the PMP features the ability to buffer reads and writes in both directions, and can read and write from different addresses. Refer to **23.0 “Parallel Master Port (PMP)”** and **Section 43. “Parallel Master Port”** (DS60001346) for information.
