Welcome to E-XFL.COM

What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Note: This data sheet summarizes the features of the PIC32MZ EF family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 15. "Input Capture"** (DS60001122) of the *"PIC32 Family Reference Manual"*, which is available from the Microchip web site (www.microchip.com/PIC32).

The Input Capture module is useful in applications requiring frequency (period) and pulse measurement.

The Input Capture module captures the 16-bit or 32-bit value of the selected Time Base registers when an event occurs at the ICx pin.

Capture events are caused by the following:

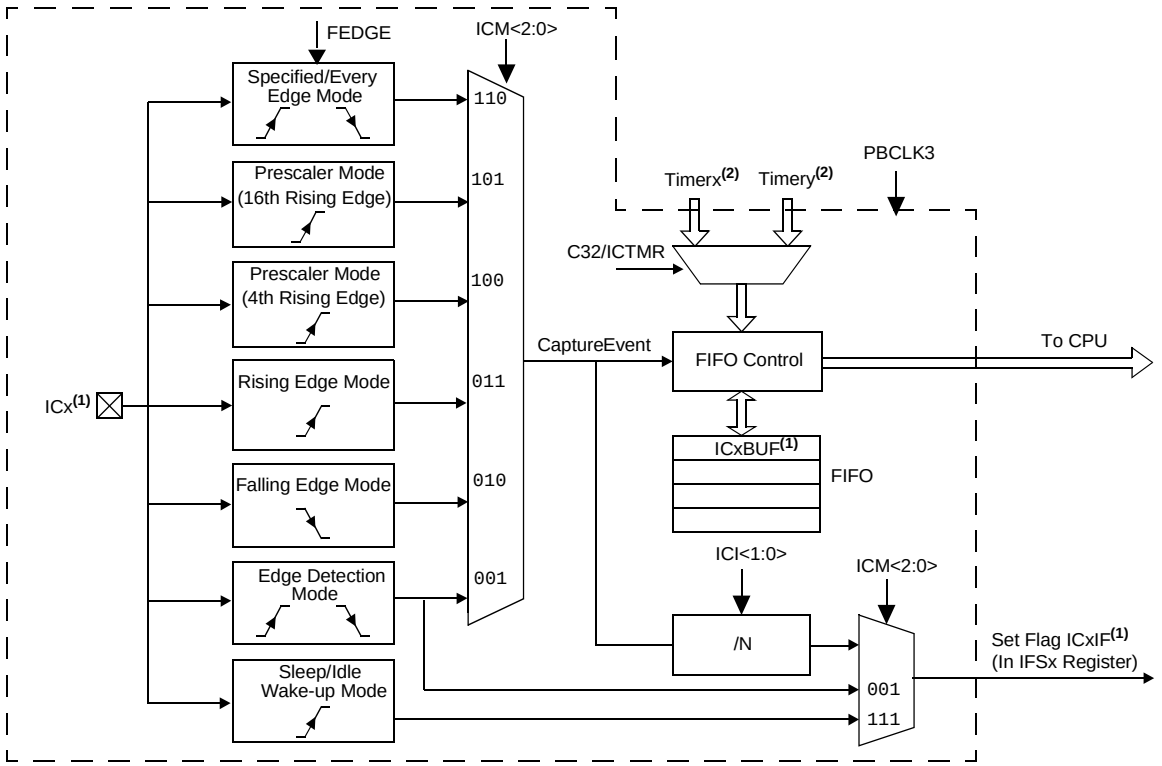
- Capture timer value on every edge (rising and falling), specified edge first
- Prescaler capture event modes:
  - Capture timer value on every 4th rising edge of input at ICx pin
  - Capture timer value on every 16th rising edge of input at ICx pin

Each input capture channel can select between one of six 16-bit timers for the time base, or two of six 16-bit timers together to form a 32-bit timer. The selected timer can use either an internal or external clock.

Other operational features include:

- Device wake-up from capture pin during Sleep and Idle modes
- Interrupt on input capture event
- 4-word FIFO buffer for capture values; Interrupt optionally generated after 1, 2, 3, or 4 buffer locations are filled
- Input capture can also be used to provide additional sources of external interrupts

FIGURE 17-1: INPUT CAPTURE BLOCK DIAGRAM



Note 1: An 'x' in a signal, register or bit name denotes the number of the capture channel.

2: See Table 17-1 for Timerx and Timery selections.

REGISTER 28-16: ADCFLTRx: ADC DIGITAL FILTER 'x' REGISTER ('x' = 1 THROUGH 6)

bit 24 **AFRDY:** Digital Filter 'x' Data Ready Status bit
1 = Data is ready in the FLTRDATA<15:0> bits
0 = Data is not ready

Note: This bit is cleared by reading the FLTRDATA<15:0> bits or by disabling the Digital Filter module (by setting AFEN to '0').

bit 23-21 **Unimplemented:** Read as '0'

bit 20-16 **CHNLID<4:0>:** Digital Filter Analog Input Selection bits
These bits specify the analog input to be used as the oversampling filter data source.

01100 = Reserved
01011 = AN11

Note: Only the first 12 analog inputs, Class 1 (AN0-AN11) and Class 2 (AN5-AN11), can use a digital filter.

bit 15-0 **FLTRDATA<15:0>:** Digital Filter 'x' Data Output Value bits
The filter output data is as per the fractional format set in the FRACT bit (ADCCON1<23>). The FRACT bit should not be changed while the filter is enabled. Changing the state of the FRACT bit after the operation of the filter ended will not update the value of the FLTRDATA<15:0> bits to reflect the new format.

REGISTER 30-1: ETHCON1: ETHERNET CONTROLLER CONTROL REGISTER 1 (CONTINUED)

bit 7 **AUTOFC:** Automatic Flow Control bit

1 = Automatic Flow Control enabled
0 = Automatic Flow Control disabled

Setting this bit will enable automatic Flow Control. If set, the full and empty watermarks are used to automatically enable and disable the Flow Control, respectively. When the number of received buffers BUFCNT (ETHSTAT<16:23>) rises to the full watermark, Flow Control is automatically enabled. When the BUFCNT falls to the empty watermark, Flow Control is automatically disabled.

This bit is only used for Flow Control operations and affects both TX and RX operations.

bit 6-5 **Unimplemented:** Read as '0'

bit 4 **MANFC:** Manual Flow Control bit

1 = Manual Flow Control is enabled
0 = Manual Flow Control is disabled

Setting this bit will enable manual Flow Control. If set, the Flow Control logic will send a PAUSE frame using the PAUSE timer value in the PTV register. It will then resend a PAUSE frame every 128 * PTV<15:0>/2 TX clock cycles until the bit is cleared.

Note: For 10 Mbps operation, TX clock runs at 2.5 MHz. For 100 Mbps operation, TX clock runs at 25 MHz.

When this bit is cleared, the Flow Control logic will automatically send a PAUSE frame with a 0x0000 PAUSE timer value to disable Flow Control.

This bit is only used for Flow Control operations and affects both TX and RX operations.

bit 3-1 **Unimplemented:** Read as '0'

bit 0 **BUFCDEC:** Descriptor Buffer Count Decrement bit

The BUFCDEC bit is a write-1 bit that reads as '0'. When written with a '1', the Descriptor Buffer Counter, BUFCNT, will decrement by one. If BUFCNT is incremented by the RX logic at the same time that this bit is written, the BUFCNT value will remain unchanged. Writing a '0' will have no effect.

This bit is only used for RX operations.

Note 1: It is not recommended to clear the RXEN bit and then make changes to any RX related field/register. The Ethernet Controller must be reinitialized (ON cleared to '0'), and then the RX changes applied.

38.0 EXTENDED TEMPERATURE ELECTRICAL CHARACTERISTICS

This section provides an overview of the PIC32MZ EF electrical characteristics for devices running up to 125ºC. Additional information will be provided in future revisions of this document as it becomes available.

The specifications for Extended Temperature are identical to those shown in **37.0 "Electrical Characteristics"**, with the exception of the parameters listed in this chapter.

Parameters in this chapter begin with the letter "E", which denotes Extended Temperature operation. For example, parameter DC28 in **37.0 "Electrical Characteristics"**, is the Extended Temperature operation equivalent for EDC28.

Absolute maximum ratings for the PIC32MZ EF devices are listed below. Exposure to these maximum rating conditions for extended periods may affect device reliability. Functional operation of the device at these or any other conditions, above the parameters indicated in the operation listings of this specification, is not implied.

Absolute Maximum Ratings

(See Note 1)

Ambient temperature under bias.....-40°C to +125°C

Note	**1:**	Stresses above those listed under **"Absolute Maximum Ratings"** may cause permanent damage to the device. This is a stress rating only and functional operation of the device at those or any other conditions, above those indicated in the operation listings of this specification, is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

B.3 CPU

The CPU in PIC32MZ EC devices is the microAptiv™ MPU architecture. The CPU in the PIC32MZ EF devices is the Series 5 Warrior M-Class M5150 MPU architecture. Most PIC32MZ EF M-Class core features are identical to the microAptiv™ core in PIC32MZ EC devices. The main differences are that in PIC32MZ EF devices, a floating-point unit (FPU) is included for improved math performance, and PC Sampling for performance measurement.

B.4 System Bus

The system bus on PIC32MZ EF devices is similar to the system bus on PIC32MZ EC devices. There are two key differences listed in Table B-3.

TABLE B-3: SYSTEM BUS DIFFERENCES

PIC32MZ EC Feature	PIC32MZ EF Feature
Permission Groups during NMI	
On PIC32MZ EC devices, the permission group in which the CPU is part of is lost during NMI handling, and must be manually restored.	On PIC32MZ EF devices, the prior permission group is preserved, and is restored when the CPU returns from the NMI handler.
DMA Access	
The DMA can access the peripheral registers on Peripheral Bus 1.	On PIC32MZ EF devices, the DMA no longer has access to registers on Peripheral Bus 1. Refer to Table 4-4 for details on which peripherals are now excluded.

B.5 Flash Controller

The Flash controller on PIC32MZ EF devices adds the ability both to control boot Flash aliasing, and for locking the current swap settings. Table B-4 lists theses differences.

TABLE B-4: FLASH CONTROLLER DIFFERENCES

PIC32MZ EC Feature	PIC32MZ EF Feature
Boot Flash Aliasing	
On PIC32MZ EC devices, Boot Flash aliasing is done through the DEVSEQ0 register, but no further changes are possible without rebooting the processor.	On PIC32MZ EF devices, the initial Boot Flash aliasing is determined by the DEVSEQ3 register, but the BFSWAP bit (NVMCON<6>) reflects the state of the aliasing, and can be modified to change it during run-time. BFSWAP (NVMCON<6>) 1 = Boot Flash Bank 2 is mapped to the lower boot alias, and Boot Flash bank 1 is mapped to the upper boot alias 0 = Boot Flash Bank 1 is mapped to the lower boot alias, and Boot Flash Bank 2 is mapped to the upper boot alias
PFM and BFM Swap Locking	
On PIC32MZ EC devices, the swapping of PFM is always available.	On PIC32MZ EF devices, a new control, SWAPLOCK<1:0> (NVMCON2<7:6>) allows the locking of PFSWAP and BFSWAP bits, and can restrict any further changes. SWAPLOCK<1:0> (NVMCON2<7:6>) 11 = PFSWAP and BFSWAP are not writable and SWAPLOCK is not writable 10 = PFSWAP and BFSWAP are not writable and SWAPLOCK is writable 01 = PFSWAP and BFSWAP are not writable and SWAPLOCK is writable 00 = PFSWAP and BFSWAP are writable and SWAPLOCK is writable
