What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

bit 31-0 **DMAADDR<31:0>:** DMA Memory Address bits

This register identifies the current memory address of the corresponding DMA channel. The initial memory address written to this register during initialization must have a value such that its modulo 4 value is equal to '0'. The lower two bits of this register are read only and cannot be set by software. As the DMA transfer progresses, the memory address will increment as bytes are transferred.

19.0 SERIAL PERIPHERAL INTERFACE (SPI) AND INTER-IC SOUND (I^2S)

Note: This data sheet summarizes the features of the PIC32MZ EF family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 23. "Serial Peripheral Interface (SPI)"** (DS60001106) in the *"PIC32 Family Reference Manual"*, which is available from the Microchip web site (www.microchip.com/PIC32).

The SPI/I^2S module is a synchronous serial interface that is useful for communicating with external peripherals and other microcontroller devices, as well as digital audio devices. These peripheral devices may be Serial EEPROMs, Shift registers, display drivers, Analog-to-Digital Converters, and so on.

The SPI/I^2S module is compatible with Motorola® SPI and SIOP interfaces.

The following are key features of the SPI module:

- Master and Slave modes support
- Four different clock formats
- Enhanced Framed SPI protocol support
- User-configurable 8-bit, 16-bit and 32-bit data width
- Separate SPI FIFO buffers for receive and transmit
  - FIFO buffers act as 4/8/16-level deep FIFOs based on 32/16/8-bit data width
- Programmable interrupt event on every 8-bit, 16-bit and 32-bit data transfer
- Operation during Sleep and Idle modes
- Audio Codec Support:
  - I^2S protocol
  - Left-justified
  - Right-justified
  - PCM
