Microchip Technology - PIC32MZ1024EFF144-E/PL Datasheet

Welcome to E-XFL.COM

What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Active
Core Processor	MIPS32® M-Class
Core Size	32-Bit Single-Core
Speed	180MHz
Connectivity	CANbus, EBI/EMI, Ethernet, I²C, PMP, SPI, SQI, UART/USART, USB OTG
Peripherals	Brown-out Detect/Reset, DMA, I²S, POR, PWM, WDT
Number of I/O	120
Program Memory Size	1MB (1M x 8)
Program Memory Type	FLASH
EEPROM Size	-
RAM Size	256K x 8
Voltage - Supply (Vcc/Vdd)	2.1V ~ 3.6V
Data Converters	A/D 48x12b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 125°C (TA)
Mounting Type	Surface Mount
Package / Case	144-LQFP
Supplier Device Package	144-LQFP (20x20)
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/pic32mz1024eff144-e-pl

TABLE 3: PIN NAMES FOR 100-PIN DEVICES

100-PIN TQFP (TOP VIEW)

PIC32MZ0512EF(E/F/K)100
PIC32MZ1024EF(G/H/M)100
PIC32MZ1024EF(E/F/K)100
PIC32MZ2048EF(G/H/M)100

100

35	AN6/ERXERR/AETXERR/RB11	70	EMDC/AEMDC/RPD11/RD11

Note 1: The RPn pins can be used by remappable peripherals. See Table 1 for the available peripherals and **Section 12.4 "Peripheral Pin Select (PPS)"** for restrictions.

2: Every I/O port pin (RAx-RGx) can be used as a change notification pin (CNAx-CNGx). See **Section 12.0 "I/O Ports"** for more information.

3: Shaded pins are 5V tolerant.

Referenced Sources

This device data sheet is based on the following individual sections of the *"PIC32 Family Reference Manual"*. These documents should be considered as the general reference for the operation of a particular module or device feature.

Legend: x = unknown value on Reset; — = unimplemented, read as '0'. Reset values are shown in hexadecimal.

Note 1: All registers in this table with the exception of the OFFx registers, have corresponding CLR, SET, and INV registers at their virtual addresses, plus offsets of 0x4, 0x8 and 0xC, respectively. See **Section 12.3 "CLR, SET, and INV Registers"** for more information.
2: This bit or register is not available on 64-pin devices.
3: This bit or register is not available on devices without a CAN module.
4: This bit or register is not available on 100-pin devices.
5: Bits 31 and 30 are not available on 64-pin and 100-pin devices; bits 29 through 14 are not available on 64-pin devices.
6: Bits 31, 30, 29, and bits 5 through 0 are not available on 64-pin and 100-pin devices; bit 31 is not available on 124-pin devices; bit 22 is not available on 64-pin devices.
7: This bit or register is not available on devices without a Crypto module.
8: This bit or register is not available on 124-pin devices.

REGISTER 7-7: IPCx: INTERRUPT PRIORITY CONTROL REGISTER

	CHBUSY	—	CHIPGNEN	—	CHPATLEN	—	—	CHCHNS(1)
7:0	R/W-0	R/W-0	R/W-0	R/W-0	U-0	R-0	R/W-0	R/W-0
	CHEN(2)	CHAED	CHCHN	CHAEN	—	CHEDET	CHPRI<1:0>	

Legend:			
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31-24 **CHPIGN<7:0>:** Channel Register Data bits
Pattern Terminate mode:
Any byte matching these bits during a pattern match may be ignored during the pattern match determination when the CHPIGNEN bit is set. If a byte is read that is identical to this data byte, the pattern match logic will treat it as a "don't care" when the pattern matching logic is enabled and the CHPIGEN bit is set.

bit 23-16 **Unimplemented:** Read as '0'

bit 15 **CHBUSY:** Channel Busy bit
1 = Channel is active or has been enabled
0 = Channel is inactive or has been disabled

bit 14 **Unimplemented:** Read as '0'

bit 13 **CHPIGNEN:** Enable Pattern Ignore Byte bit
1 = Treat any byte that matches the CHPIGN<7:0> bits as a "don't care" when pattern matching is enabled
0 = Disable this feature

bit 12 **Unimplemented:** Read as '0'

bit 11 **CHPATLEN:** Pattern Length bit
1 = 2 byte length
0 = 1 byte length

bit 10-9 **Unimplemented:** Read as '0'

bit 8 **CHCHNS:** Chain Channel Selection bit(1)
1 = Chain to channel lower in natural priority (CH1 will be enabled by CH2 transfer complete)
0 = Chain to channel higher in natural priority (CH1 will be enabled by CH0 transfer complete)

bit 7 **CHEN:** Channel Enable bit(2)
1 = Channel is enabled
0 = Channel is disabled

bit 6 **CHAED:** Channel Allow Events If Disabled bit
1 = Channel start/abort events will be registered, even if the channel is disabled
0 = Channel start/abort events will be ignored if the channel is disabled

bit 5 **CHCHN:** Channel Chain Enable bit
1 = Allow channel to be chained
0 = Do not allow channel to be chained

Note 1: The chain selection bit takes effect when chaining is enabled (i.e., CHCHN = 1).

2: When the channel is suspended by clearing this bit, the user application should poll the CHBUSY bit (if available on the device variant) to see when the channel is suspended, as it may take some clock cycles to complete a current transaction before the channel is suspended.

REGISTER 11-26: USBTMCON1: USB TIMING CONTROL REGISTER 1

Bit Range	Bit 31/23/15/7	Bit 30/22/14/6	Bit 29/21/13/5	Bit 28/20/12/4	Bit 27/19/11/3	Bit 26/18/10/2	Bit 25/17/9/1	Bit 24/16/8/0

	TUCH<7:0>							

Legend:			
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31-16 **THHSRTN:<15:0>:** Hi-Speed Resume Signaling Delay bits
These bits set the delay from the end of Hi-Speed resume signaling (acting as a Host) to enable the UTM normal operating mode.

bit 15-0 **TUCH<15:0>:** Chirp Time-out bits
These bits set the chirp time-out. This number, when multiplied by 4, represents the number of USB module clock cycles before the time-out occurs.

Note: Use of this register will allow the Hi-Speed time-out to be set to values that are greater than the maximum specified in the USB 2.0 specification, making the USB module non-compliant.

REGISTER 11-27: USBTMCON2: USB TIMING CONTROL REGISTER 2

Bit Range	Bit 31/23/15/7	Bit 30/22/14/6	Bit 29/21/13/5	Bit 28/20/12/4	Bit 27/19/11/3	Bit 26/18/10/2	Bit 25/17/9/1	Bit 24/16/8/0

	—	—	—	—	THBST<3:0>			

Legend:			
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31-4 **Unimplemented:** Read as '0'

bit 3-0 **THBST<3:0>:** High Speed Time-out Adder bits
These bits represent the value to be added to the minimum high speed time-out period of 736 bit times. The time-out period can be increased in increments of 64 Hi-Speed bit times (133 ns).

Note: Use of this register will allow the Hi-Speed time-out to be set to values that are greater than the maximum specified in the USB 2.0 specification, making the USB module non-compliant.

	OBE	OBUF	—	—	OB3E	OB2E	OB1E	OB0E

Legend:	HS = Hardware Set	SC = Software Cleared	
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31-16 **Unimplemented:** Read as '0'

bit 15 **IBF:** Input Buffer Full Status bit
- 1 = All writable input buffer registers are full
- 0 = Some or all of the writable input buffer registers are empty

bit 14 **IBOV:** Input Buffer Overflow Status bit
- 1 = A write attempt to a full input byte buffer is occurred (must be cleared in software)
- 0 = No overflow is occurred

bit 13-12 **Unimplemented:** Read as '0'

bit 11-8 **IBxF:** Input Buffer x Status Full bits
- 1 = Input Buffer contains data that has not been read (reading buffer will clear this bit)
- 0 = Input Buffer does not contain any unread data

bit 7 **OBE:** Output Buffer Empty Status bit
- 1 = All readable output buffer registers are empty
- 0 = Some or all of the readable output buffer registers are full

bit 6 **OBUF:** Output Buffer Underflow Status bit
- 1 = A read occurred from an empty output byte buffer (must be cleared in software)
- 0 = No underflow is occurred

bit 5-4 **Unimplemented:** Read as '0'

bit 3-0 **OBxE:** Output Buffer x Status Empty bits
- 1 = Output buffer is empty (writing data to the buffer will clear this bit)
- 0 = Output buffer contains data that has not been transmitted

25.0 REAL-TIME CLOCK AND CALENDAR (RTCC)

Note: This data sheet summarizes the features of the PIC32MZ EF family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 29. "Real-Time Clock and Calendar (RTCC)"** (DS60001125) in the *"PIC32 Family Reference Manual"*, which is available from the Microchip web site (www.microchip.com/PIC32).

The RTCC module is intended for applications in which accurate time must be maintained for extended periods of time with minimal or no CPU intervention. Low-power optimization provides extended battery lifetime while keeping track of time.

The following are key features of the RTCC module:

- Time: hours, minutes, and seconds
- 24-hour format (military time)
- Visibility of one-half second period
- Provides calendar: Weekday, date, month and year
- Alarm intervals are configurable for half of a second, one second, 10 seconds, one minute, 10 minutes, one hour, one day, one week, one month, and one year
- Alarm repeat with decrementing counter
- Alarm with indefinite repeat: Chime
- Year range: 2000 to 2099
- Leap year correction
- BCD format for smaller firmware overhead
- Optimized for long-term battery operation
- Fractional second synchronization
- User calibration of the clock crystal frequency with auto-adjust
- Calibration range: ±0.66 seconds error per month
- Calibrates up to 260 ppm of crystal error
- Uses external 32.768 kHz crystal or 32 kHz internal oscillator
- Alarm pulse, seconds clock, or internal clock output on RTCC pin

1 = Allow only one reconfiguration
0 = Allow multiple reconfigurations

bit 26 **Reserved:** Write as '1'

bit 25 **FETHIO:** Ethernet I/O Pin Selection Configuration bit
1 = Default Ethernet I/O pins
0 = Alternate Ethernet I/O pins

This bit is ignored for devices that do not have an alternate Ethernet pin selection.

bit 24 **FMIIEN:** Ethernet MII Enable Configuration bit
1 = MII is enabled
0 = RMII is enabled

bit 23-16 **Reserved:** Write as '1'

bit 15-0 **USERID<15:0>:** This is a 16-bit value that is user-defined and is readable via ICSP™ and JTAG

34.3 On-Chip Voltage Regulator

The core and digital logic for all PIC32MZ EF devices is designed to operate at a nominal 1.8V. To simplify system designs, devices in the PIC32MZ EF family incorporate an on-chip regulator providing the required core logic voltage from VDD.

34.3.1 ON-CHIP REGULATOR AND POR

It takes a fixed delay for the on-chip regulator to generate an output. During this time, designated as TPU, code execution is disabled. TPU is applied every time the device resumes operation after any power-down, including Sleep mode.

34.3.2 ON-CHIP REGULATOR AND BOR

PIC32MZ EF devices also have a simple brown-out capability. If the voltage supplied to the regulator is inadequate to maintain a regulated level, the regulator Reset circuitry will generate a Brown-out Reset. This event is captured by the BOR flag bit (RCON<1>). The brown-out voltage levels are specific in **Section 37.1 "DC Characteristics"**.

34.4 On-chip Temperature Sensor

PIC32MZ EF devices include a temperature sensor that provides accurate measurement of a device's junction temperature (see **Section 37.2 "AC Characteristics and Timing Parameters"** for more information).

The temperature sensor is connected to the ADC module and can be measured using the shared S&H circuit (see **Section 28.0 "12-bit High-Speed Successive Approximation Register (SAR) Analog-to-Digital Converter (ADC)"** for more information).

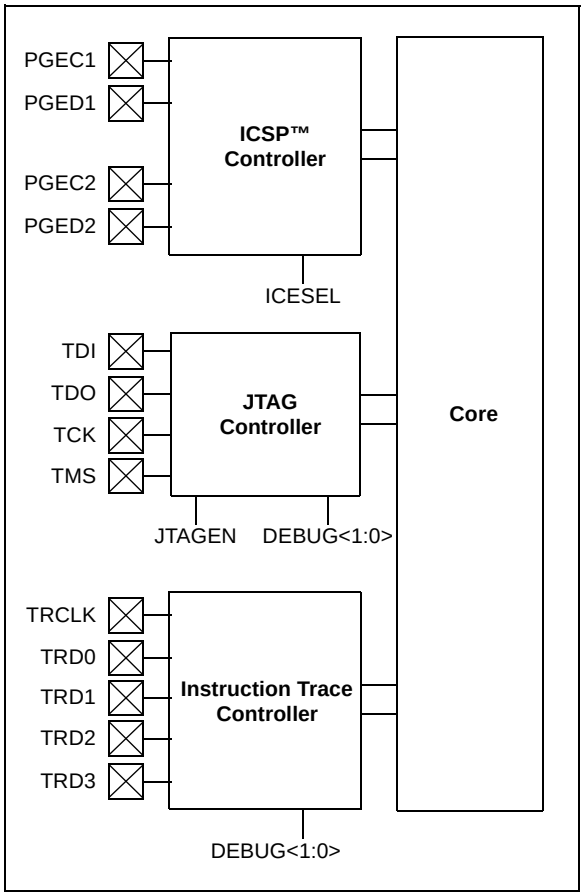
34.5 Programming and Diagnostics

PIC32MZ EF devices provide a complete range of programming and diagnostic features that can increase the flexibility of any application using them. These features allow system designers to include:

- Simplified field programmability using two-wire In-Circuit Serial Programming™ (ICSP™) interfaces
- Debugging using ICSP
- Programming and debugging capabilities using the EJTAG extension of JTAG
- JTAG boundary scan testing for device and board diagnostics

PIC32 devices incorporate two programming and diagnostic modules, and a trace controller, that provide a range of functions to the application developer.

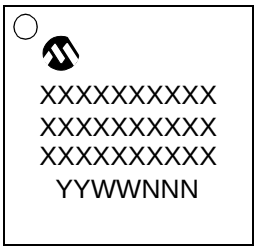
FIGURE 34-1: BLOCK DIAGRAM OF PROGRAMMING, DEBUGGING AND TRACE PORTS



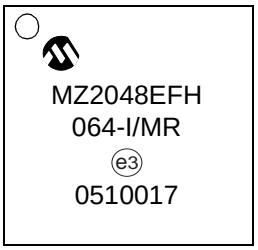
41.0 PACKAGING INFORMATION

41.1 Package Marking Information

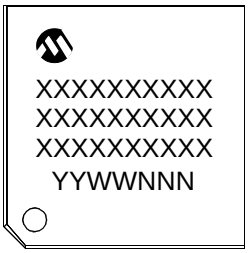
64-Lead QFN (9x9x0.9 mm)



Example

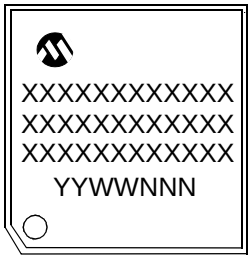


64-Lead TQFP (10x10x1 mm)

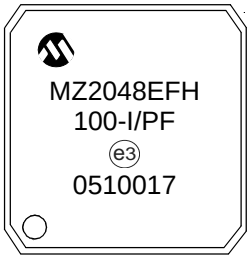


Example

100-Lead TQFP (14x14x1 mm)



Example



Legend:	XX...X	Customer-specific information
	Y	Year code (last digit of calendar year)
	YY	Year code (last 2 digits of calendar year)
	WW	Week code (week of January 1 is week ‘01’)
	NNN	Alphanumeric traceability code
		Pb-free JEDEC designator for Matte Tin (Sn)
	*	This package is Pb-free. The Pb-free JEDEC designator (e3) can be found on the outer packaging for this package.

Note: In the event the full Microchip part number cannot be marked on one line, it will be carried over to the next line, thus limiting the number of available characters for customer-specific information.

B.10 Serial Quad Interface (SQI)

On PIC32MZ EF devices, the SQI module has been updated with the following features:

- FIFOs can be reset through the CONFIFORST (SQI1CFG<19>), RXFIFORST (SQI1CFG<18>), and TXFIFORST (SQI1CFG<17>) bits in Register 20-3
- A new Flash Status check is available, which will allow the SQI to automatically query the status of the external device during write/erase operations without software intervention. See the SCHECK bit (SQI1CON<24>) and the SQI1MEMSTAT register (Register 20-4 and Register 20-24, respectively).
- The SQI clock divider bits have been expanded, and can use an undivided clock. See the CLKDIV<10:0> bits (SQI1CLKCON<18:8>) in Register 20-5.
- A new DMA Bus Error Interrupt is available through the DMAEIE (SQI1INTEN<11>), DMAEIF (SQI1INTSTAT<11>), and DMAEISE (SQI1INTSIGEN<11>) bits in Register 20-8, Register 20-9, and Register 20-22, respectively
- The SQI1STAT2 register (see Register 20-13) has two new fields:
  - CMDSTAT<1:0> (SQI1STAT2<17:16>) indicates the current command status
  - CONAVAIL<4:0> (SQI1STAT<11:8>) indicates how many spaces are available in the Control FIFO.
- The TAP Controller within the SQI can be configured for various timing requirements via the SQI1TAPCON register (Register 20-23)
- Two new XIP mode registers (SQI1XCON3 and SQI1XCON4) have been added for additional command sequencing (see Register 20-25 and Register 20-26, respectively)

Refer to **20.0 “Serial Quad Interface (SQI)”** and **Section 46. “Serial Quad Interface (SQI)”** (DS60001128) for more information.

B.11 PMP

On PIC32MZ EF devices, the PMP features the ability to buffer reads and writes in both directions, and can read and write from different addresses. Refer to **23.0 “Parallel Master Port (PMP)”** and **Section 43. “Parallel Master Port”** (DS60001346) for information.

Revision C (March 2016)

In this revision, the Preliminary status was removed from the document footer.

The revision also includes the following major changes, which are referenced by their respective chapter in Table C-2. In addition, minor updates to text and formatting were incorporated throughout the document.

TABLE C-2: MAJOR SECTION UPDATES

Section Name	Update Description
2.0 "Guidelines for Getting Started with 32-bit Microcontrollers"	**2.9.1.3 "EMI/EMC/EFT (IEC 61000-4-4 and IEC 61000-4-2) Suppression Considerations"** and Figure 2-5 were updated.
4.0 "Memory Organization"	The names of the Boot Flash Words were updated from BFxSEQ0 to BFxSEQ3 (see **4.1.1 "Boot Flash Sequence and Configuration Spaces"**). The ABFxSEQx registers were removed from the Boot Flash Sequence and Configuration tables (see Table 4-2 and Table 4-3).
7.0 "CPU Exceptions and Interrupt Controller"	The Cache Error exception type was removed from the MIPS32 M-Class Microprocessor Core Exception Types (see Table 7-1).
8.0 "Oscillator Configuration"	The PLLODIV<2:0> bit value settings were updated in the SPLLCON register (see Register 8-3).
12.0 "I/O Ports"	The SIDL bit was removed from the CNCONx registers (see Table 12-4 through Table 12-21 and Register 12-3).
20.0 "Serial Quad Interface (SQI)"	The following bits were removed from the SQI1XCON1 register (see Table 20-1 and Register 20-1): DDRDATA, DDRDUMMY, DDRMODE, DDRADDR, and DDRCMD. The DDRMODE bit was removed from the SQI1CON register (see Table 20-1 and Register 20-4).
28.0 "12-bit High-Speed Successive Approximation Register (SAR) Analog-to-Digital Converter (ADC)"	A note was added to the SELRES<1:0> bits in the ADCCON1 and ADCxTIME registers (see Register 28-1 and Register 28-27). The ADCID<2:0 bit values were updated in the ADCFSTAT register (see Register 28-22).
34.0 "Special Features"	The bit value definitions for the POSCGAIN<1:0> and SOSCGAIN<1:0> bits were updated (see Register 34-3). The Device ADC Calibration Word (DEVADCx) register was added (see Table 34-5 and Register 34-13).
