What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Active
Core Processor	MIPS32® M-Class
Core Size	32-Bit Single-Core
Speed	250MHz
Connectivity	EBI/EMI, Ethernet, I²C, PMP, SPI, SQI, UART/USART, USB OTG
Peripherals	Brown-out Detect/Reset, DMA, I²S, POR, PWM, WDT
Number of I/O	78
Program Memory Size	1MB (1M x 8)
Program Memory Type	FLASH
EEPROM Size	-
RAM Size	512K x 8
Voltage - Supply (Vcc/Vdd)	2.1V ~ 3.6V
Data Converters	A/D 40x12b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 85°C (TA)
Mounting Type	Surface Mount
Package / Case	100-TQFP
Supplier Device Package	100-TQFP (12x12)

4.0 MEMORY ORGANIZATION

Note: This data sheet summarizes the features of the PIC32MZ EF family of devices. It is not intended to be a comprehensive reference source.For detailed information, refer to **Section 48. "Memory Organization and Permissions"** in the *"PIC32 Family Reference Manual"*, which is available from the Microchip web site (www.microchip.com/PIC32).

PIC32MZ EF microcontrollers provide 4 GB of unified virtual memory address space. All memory regions, including program, data memory, SFRs and Configuration registers, reside in this address space at their respective unique addresses. The program and data memories can be optionally partitioned into user and kernel memories. In addition, PIC32MZ EF devices allow execution from data memory.

Key features include:

- 32-bit native data width
- Separate User (KUSEG) and Kernel (KSEG0/ KSEG1/KSEG2/KSEG3) mode address space
- Separate boot Flash memory for protected code
- Robust bus exception handling to intercept runaway code
- Cacheable (KSEG0/KSEG2) and non-cacheable (KSEG1/KSEG3) address regions
- Read/write permission access to predefined memory regions

4.1 Memory Layout

PIC32MZ EF microcontrollers implement two address schemes: virtual and physical. All hardware resources, such as program memory, data memory and peripherals, are located at their respective physical addresses. Virtual addresses are exclusively used by the CPU to fetch and execute instructions as well as access peripherals. Physical addresses are used by bus master peripherals, such as DMA and the Flash controller, that access memory independently of the CPU.

The main memory maps for the PIC32MZ EF devices are illustrated in Figure 4-1 through Figure 4-4. Figure 4-5 provides memory map information for boot Flash and boot alias. Table 4-1 provides memory map information for Special Function Registers (SFRs).

24.0 EXTERNAL BUS INTERFACE (EBI)

Note: This data sheet summarizes the features of the PIC32MZ EF family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 47. "External Bus Interface (EBI)"** (DS60001245) in the *"PIC32 Family Reference Manual"*, which is available from the Microchip web site (www.microchip.com/PIC32).

The External Bus Interface (EBI) module provides a high-speed, convenient way to interface external parallel memory devices to the PIC32MZ EF family device.

With the EBI module, it is possible to connect asynchronous SRAM and NOR Flash devices, as well as non-memory devices such as camera sensors and LCDs.

The features of the EBI module depend on the pin count of the PIC32MZ EF device, as shown in Table 24-1.

Note: The EBI module is not available on 64-pin devices.

TABLE 24-1: EBI MODULE FEATURES

Feature	Number of Device Pins		
	100	124	144
Async SRAM	Y	Y	Y
Async NOR Flash	Y	Y	Y
Available address lines	20	20	24
8-bit data bus support	Y	Y	Y
16-bit data bus support	Y	Y	Y
Available Chip Selects	1	1	4
Timing mode sets	3	3	3
8-bit R/W from 16-bit bus	N	N	Y
Non-memory device	Y	Y	Y
LCD	Y	Y	Y

Note: Once the EBI module is configured, external devices will be memory mapped and can be access from KSEG2 memory space (see Figure 4-1 through Figure 4-4 in **Section 4.0 "Memory Organization"** for more information). The MMU must be enabled and the TLB must be set up to access this memory (refer to **Section 50. "CPU for Devices with MIPS32® microAptiv™ and M-Class Cores"** (DS60001192) of the *"PIC32 Family Reference Manual"* for more information).

5: To achieve maximum data rate, VDD must be ≥ 3.3V, the SMP bit (SPIxCON<9>) must be equal to ‘1’, and the operating temperature must be within the range of -40°C to +105°C.

39.2 AC Characteristics and Timing Parameters

The information contained in this section defines PIC32MZ EF device AC characteristics and timing parameters.

TABLE 39-5: SYSTEM TIMING REQUIREMENTS

AC CHARACTERISTICS			Standard Operating Conditions: 2.1V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial				
Param. No.	**Symbol**	**Characteristics**	**Minimum**	**Typical**	**Maximum**	**Units**	**Conditions**
MOS51	FSYS	System Frequency	DC	—	252	MHz	USB module disabled
			60	—	252	MHz	USB module enabled
MOS55a	FPB	Peripheral Bus Frequency	DC	—	100	MHz	For PBCLKx, 'x' ≠ 4, 7 (see **Note 1**)
MOS55b			DC	—	200	MHz	For PBCLK4
MOS55c			DC	—	252	MHz	For PBCLK7
MOS56	FREF	Reference Clock Frequency	—	—	50	MHz	For REFCLKI1, 3, 4 and REFCLKO1, 3, 4 pins

Note 1: If the DEVCFG registers are configured for a SYSCLK speed greater than 200 MHz, these PBCLKs will be running faster than the maximum rating when the device comes out of Reset. To ensure proper operation, firmware must start the device at a speed less than or equal to 200 MHz, adjust the speed of the PBCLKs, and then raise the SYSCLK speed to the desired speed.

TABLE 39-6: PLL CLOCK TIMING SPECIFICATIONS

AC CHARACTERISTICS			Standard Operating Conditions: 2.1V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial				
Param. No.	**Symbol**	**Characteristics(1)**	**Min.**	**Typical**	**Max.**	**Units**	**Conditions**
MOS54a	FPLL	PLL Output Frequency Range	10	—	252	MHz	—

Note 1: These parameters are characterized, but not tested in manufacturing.

2: This jitter specification is based on clock-cycle by clock-cycle measurements. To get the effective jitter for individual time-bases on communication clocks, use the following formula:

$$EffectiveJitter = \frac{D_{CLK}}{\sqrt{\frac{PBCLK2}{CommunicationClock}}}$$

For example, if PBCLK2 = 100 MHz and SPI bit rate = 50 MHz, the effective jitter is as follows:

$$EffectiveJitter = \frac{D_{CLK}}{\sqrt{\frac{100}{50}}} = \frac{D_{CLK}}{1.41}$$
