

Welcome to [E-XFL.COM](#)

### What is "[Embedded - Microcontrollers](#)"?

"[Embedded - Microcontrollers](#)" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

### Applications of "[Embedded - Microcontrollers](#)"

#### Details

Product Status	Active
Core Processor	MIPS32® M-Class
Core Size	32-Bit Single-Core
Speed	200MHz
Connectivity	EBI/EMI, Ethernet, I <sup>2</sup> C, PMP, SPI, SQI, UART/USART, USB OTG
Peripherals	Brown-out Detect/Reset, DMA, I <sup>2</sup> S, POR, PWM, WDT
Number of I/O	78
Program Memory Size	1MB (1M x 8)
Program Memory Type	FLASH
EEPROM Size	-
RAM Size	512K x 8
Voltage - Supply (Vcc/Vdd)	2.1V ~ 3.6V
Data Converters	A/D 40x12b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 85°C (TA)
Mounting Type	Surface Mount
Package / Case	100-TQFP
Supplier Device Package	100-TQFP (12x12)
Purchase URL	<a href="https://www.e-xfl.com/product-detail/microchip-technology/pic32mz1024efg100t-i-pt">https://www.e-xfl.com/product-detail/microchip-technology/pic32mz1024efg100t-i-pt</a>

## 2.9 Designing for High-Speed Peripherals

The PIC32MZ EF family devices have peripherals that operate at frequencies much higher than typical for an embedded environment. Table 2-1 lists the peripherals that produce high-speed signals on their external pins:

**TABLE 2-1: PERIPHERALS THAT PRODUCE HS SIGNALS ON EXTERNAL PINS**

Peripheral	High-Speed Signal Pins	Maximum Speed on Signal Pin
EBI	EBIAx, EBIDx	50 MHz
SQI1	SQICLK, SQICSt, SQIDx	50 MHz
HS USB	D+, D-	480 MHz

Due to these high-speed signals, it is important to consider several factors when designing a product that uses these peripherals, as well as the PCB on which these components will be placed. Adhering to these recommendations will help achieve the following goals:

- Minimize the effects of electromagnetic interference to the proper operation of the product
- Ensure signals arrive at their intended destination at the same time
- Minimize crosstalk
- Maintain signal integrity
- Reduce system noise
- Minimize ground bounce and power sag

### 2.9.1 SYSTEM DESIGN

#### 2.9.1.1 Impedance Matching

When selecting parts to place on high-speed buses, particularly the SQI bus, if the impedance of the peripheral device does not match the impedance of the pins on the PIC32MZ EF device to which it is connected, signal reflections could result, thereby degrading the quality of the signal.

If it is not possible to select a product that matches impedance, place a series resistor at the load to create the matching impedance. See Figure 2-4 for an example.

**FIGURE 2-4: SERIES RESISTOR**

#### 2.9.1.2 PCB Layout Recommendations

The following list contains recommendations that will help ensure the PCB layout will promote the goals previously listed.

##### • Component Placement

- Place bypass capacitors as close to their component power and ground pins as possible, and place them on the same side of the PCB
- Devices on the same bus that have larger setup times should be placed closer to the PIC32MZ EF device

##### • Power and Ground

- Multi-layer PCBs will allow separate power and ground planes
- Each ground pin should be connected to the ground plane individually
- Place bypass capacitor vias as close to the pad as possible (preferably inside the pad)
- If power and ground planes are not used, maximize width for power and ground traces
- Use low-ESR, surface-mount bypass capacitors

##### • Clocks and Oscillators

- Place crystals as close as possible to the PIC32MZ EF device OSC/SOSC pins
- Do not route high-speed signals near the clock or oscillator
- Avoid via usage and branches in clock lines (SQICLK)
- Place termination resistors at the end of clock lines

##### • Traces

- Higher-priority signals should have the shortest traces
- Match trace lengths for parallel buses (EBIAx, EBIDx, SQIDx)
- Avoid long run lengths on parallel traces to reduce coupling
- Make the clock traces as straight as possible
- Use rounded turns rather than right-angle turns
- Have traces on different layers intersect on right angles to minimize crosstalk
- Maximize the distance between traces, preferably no less than three times the trace width
- Power traces should be as short and as wide as possible
- High-speed traces should be placed close to the ground plane

- Note**
- 1: Device mode.
  - 2: Host mode.
  - 3: Definition for Endpoint 0 (ENDPOINT<3:0> (USBCSR<19:16>) = 0).
  - 4: Definition for Endpoints 1-7 (ENDPOINT<3:0> (USBCSR<19:16>) = 1 through 7).

## REGISTER 11-11: USBIENCSR3: USB INDEXED ENDPOINT CONTROL STATUS REGISTER 3 (ENDPOINT 1-7) (CONTINUED)

bit 15-8 **RXINTERV<7:0>**: Endpoint RX Polling Interval/NAK Limit bits

For Interrupt and Isochronous transfers, this field defines the polling interval for the endpoint. For Bulk endpoints, this field sets the number of frames/microframes after which the endpoint should time out on receiving a stream of NAK responses.

The following table describes the valid values and meaning for this field:

Transfer Type	Speed	Valid Values (m)	Interpretation
Interrupt	Low/Full	0x01 to 0xFF	Polling interval is 'm' frames.
	High	0x01 to 0x10	Polling interval is $2^{(m-1)}$ frames.
Isochronous	Full or High	0x01 to 0x10	Polling interval is $2^{(m-1)}$ frames/microframes.
Bulk	Full or High	0x02 to 0x10	NAK limit is $2^{(m-1)}$ frames/microframes. A value of '0' or '1' disables the NAK time-out function.

bit 7-6 **SPEED<1:0>**: RX Endpoint Operating Speed Control bits

11 = Low-Speed  
10 = Full-Speed  
01 = Hi-Speed  
00 = Reserved

bit 5-4 **PROTOCOL<1:0>**: RX Endpoint Protocol Control bits

11 = Interrupt  
10 = Bulk  
01 = Isochronous  
00 = Control

bit 3-0 **TEP<3:0>**: RX Target Endpoint Number bits

This value is the endpoint number contained in the TX endpoint descriptor returned to the USB module during device enumeration.

2: This register is not available on devices without a CAN module.

## 20.0 SERIAL QUAD INTERFACE (SQI)

**Note:** This data sheet summarizes the features of the PIC32MZ EF family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 46. “Serial Quad Interface (SQI)”** (DS60001244) in the *“PIC32 Family Reference Manual”*, which is available from the Microchip web site ([www.microchip.com/PIC32](http://www.microchip.com/PIC32)).

The SQI module is a synchronous serial interface that provides access to serial Flash memories and other serial devices. The SQI module supports Single Lane (identical to SPI), Dual Lane, and Quad Lane modes.

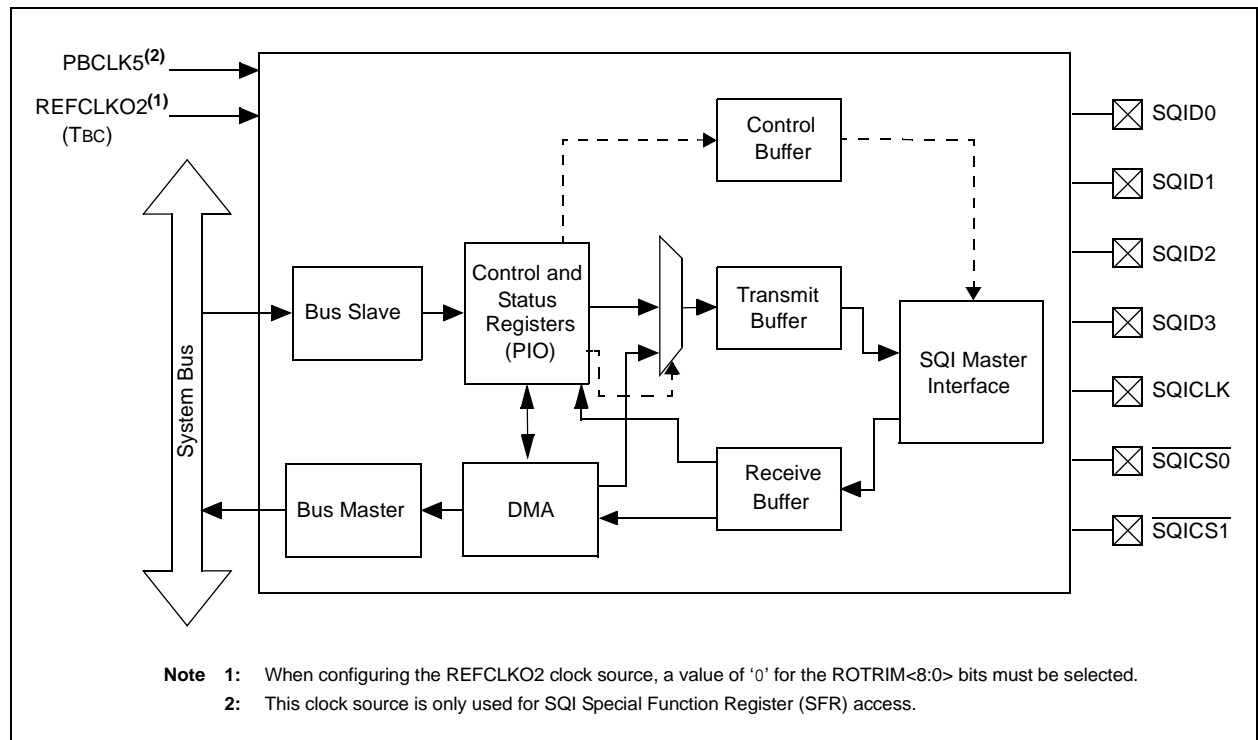

The following are key feature of the SQI module:

- Supports Single, Dual, and Quad Lane modes
- Supports Single Data Rate (SDR) mode
- Programmable command sequence
- eXecute-In-Place (XIP)

- Data transfer:
  - Programmed I/O mode (PIO)
  - Buffer descriptor DMA
- Supports SPI Mode 0 and Mode 3
- Programmable Clock Polarity (CPOL) and Clock Phase (CPHA) bits
- Supports up to two Chip Selects
- Supports up to four bytes of Flash address
- Programmable interrupt thresholds
- 32-byte transmit data buffer
- 32-byte receive data buffer
- 4-word controller buffer

**Note:** Once the SQI module is configured, external devices are memory mapped into KSEG2 and KSEG3 (see Figure 4-1 through Figure 4-4 in **Section 4.0 “Memory Organization”** for more information). The MMU must be enabled and the TLB must be set up to access this memory (refer to **Section 50. “CPU for Devices with MIPS32® microAptiv™ and M-Class Cores”** (DS60001192) of the *“PIC32 Family Reference Manual”* for more information).

U = Unimplemented bit, read as '0'

-n = Value at POR

'1' = Bit is set

'0' = Bit is cleared

x = Bit is unknown

bit 31-14 **Unimplemented:** Read as '0'

bit 13-8 **CLKINDLY<5:0>:** SQI Clock Input Delay bits

These bits are used to add fractional delays to SQI Clock Input while sampling the incoming data.

111111 = 64 taps added on clock input

111110 = 63 taps added on clock input

- 
- 
- 

000001 = 2 taps added on clock input

000000 = 1 tap added on clock input

bit 7-4 **DATAOUTDLY<3:0>:** SQI Data Output Delay bits

These bits are used to add fractional delays to SQI Data Output while writing the data to the Flash.

1111 = 16 taps added on clock output

1110 = 15 taps added on clock output

- 
- 
- 

0001 = 2 taps added on clock output

0000 = 1 tap added on clock output

bit 3-0 **CLKOUTDLY<3:0>:** SQI Clock Output Delay bits

These bits are used to add fractional delays to SQI Clock Output while writing the data to the Flash.

1111 = 16 taps added on clock output

1110 = 15 taps added on clock output

- 
- 
- 

0001 = 2 taps added on clock output

0000 = 1 tap added on clock output

	TRPD<7:0>							

**Legend:**

R = Readable bit

W = Writable bit

U = Unimplemented bit, read as '0'

-n = Value at POR

'1' = Bit is set

'0' = Bit is cleared

x = Bit is unknown

bit 31-12 **Unimplemented:** Read as '0'

bit 11-0 **TRPD<11:0>:** Flash Timing bits

These bits define the number of clock cycles to wait after resetting the external Flash memory before any read/write access.

## REGISTER 25-1: RTCCON: REAL-TIME CLOCK AND CALENDAR CONTROL REGISTER (CONTINUED)

bit 10-9 **RTCCLKSEL<1:0>**: RTCC Clock Select bits

When a new value is written to these bits, the Seconds Value register should also be written to properly reset the clock prescalers in the RTCC.

11 = Reserved

10 = Reserved

01 = RTCC uses the external 32.768 kHz Secondary Oscillator (SOSC)

00 = RTCC uses the internal 32 kHz oscillator (LPRC)

bit 8-7 **RTCOUTSEL<1:0>**: RTCC Output Data Select bits<sup>(2)</sup>

11 = Reserved

10 = RTCC Clock is presented on the RTCC pin

01 = Seconds Clock is presented on the RTCC pin

00 = Alarm Pulse is presented on the RTCC pin when the alarm interrupt is triggered

bit 6 **RTCCLKON**: RTCC Clock Enable Status bit<sup>(5)</sup>

1 = RTCC Clock is actively running

0 = RTCC Clock is not running

bit 5-4 **Unimplemented**: Read as '0'

bit 3 **RTCWREN**: Real-Time Clock Value Registers Write Enable bit<sup>(3)</sup>

1 = Real-Time Clock Value registers can be written to by the user

0 = Real-Time Clock Value registers are locked out from being written to by the user

bit 2 **RTCSYNC**: Real-Time Clock Value Registers Read Synchronization bit

1 = Real-time clock value registers can change while reading (due to a rollover ripple that results in an invalid data read). If the register is read twice and results in the same data, the data can be assumed to be valid.

0 = Real-time clock value registers can be read without concern about a rollover ripple

bit 1 **HALFSEC**: Half-Second Status bit<sup>(4)</sup>

1 = Second half period of a second

0 = First half period of a second

bit 0 **RTCOE**: RTCC Output Enable bit

1 = RTCC output is enabled

0 = RTCC output is not enabled

**Note 1:** The ON bit is only writable when RTCWREN = 1.

**2:** Requires RTCOE = 1 (RTCCON<0>) for the output to be active.

**3:** The RTCWREN bit can be set only when the write sequence is enabled.

**4:** This bit is read-only. It is cleared to '0' on a write to the seconds bit fields (RTCTIME<14:8>).

**5:** This bit is undefined when RTCCLKSEL<1:0> = 00 (LPRC is the clock source).

**Note:** This register is reset only on a Power-on Reset (POR).

## PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

---

### REGISTER 25-2: RTCALRM: REAL-TIME CLOCK ALARM CONTROL REGISTER (CONTINUED)

bit 7-0 **ARPT<7:0>**: Alarm Repeat Counter Value bits<sup>(2)</sup>

11111111 = Alarm will trigger 256 times

•  
•  
•

00000000 = Alarm will trigger one time

The counter decrements on any alarm event. The counter only rolls over from 0x00 to 0xFF if CHIME = 1.

- Note 1:** Hardware clears the ALRMEN bit anytime the alarm event occurs, when ARPT<7:0> = 00 and CHIME = 0.
- 2:** This field should not be written when the RTCC ON bit = '1' (RTCCON<15>) and ALRMSYNC = 1.

<b>Note:</b> This register is reset only on a Power-on Reset (POR).
---

## 26.3 Security Association Structure

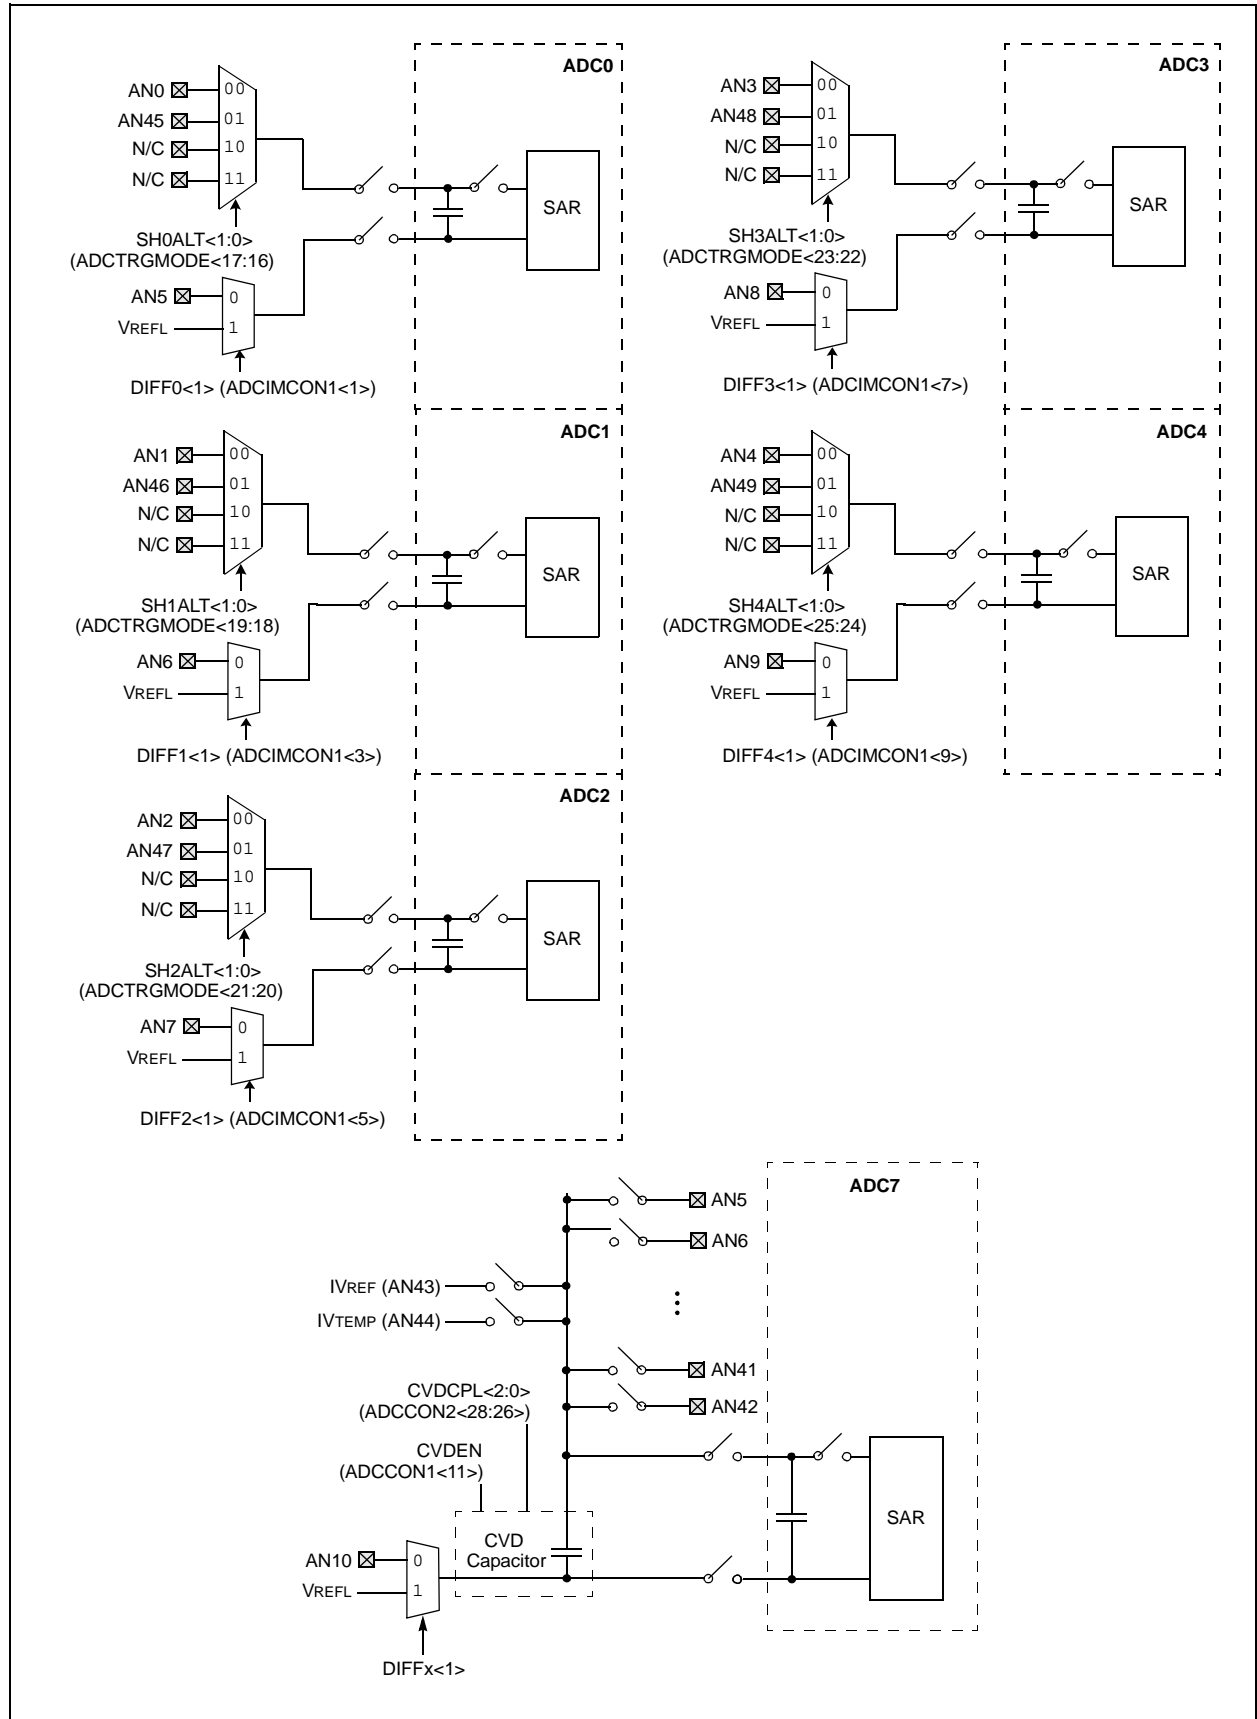

Table 26-4 shows the Security Association Structure. The Crypto Engine uses the Security Association to determine the settings for processing a Buffer Descriptor Processor. The Security Association contains:

- Which algorithm to use
- Whether to use engines in parallel (for both authentication and encryption/decryption)
- The size of the key
- Authentication key
- Encryption/decryption key
- Authentication Initialization Vector (IV)
- Encryption IV

0 = Interrupt disabled for FIFO not empty

bit 15-11 **Unimplemented:** Read as '0'

bit 10 **TXNFULLIF:** Transmit FIFO Not Full Interrupt Flag bit<sup>(1)</sup>

TXEN = 1: (FIFO configured as a Transmit Buffer)

1 = FIFO is not full  
0 = FIFO is full

TXEN = 0: (FIFO configured as a Receive Buffer)

Unused, reads '0'

**Note 1:** This bit is read-only and reflects the status of the FIFO.

## 30.0 ETHERNET CONTROLLER

**Note:** This data sheet summarizes the features of the PIC32MZ EF family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 35. “Ethernet Controller”** (DS60001155) in the “PIC32 Family Reference Manual”, which is available from the Microchip web site ([www.microchip.com/PIC32](http://www.microchip.com/PIC32)).

The Ethernet controller is a bus master module that interfaces with an off-chip Physical Layer (PHY) to implement a complete Ethernet node in a system.

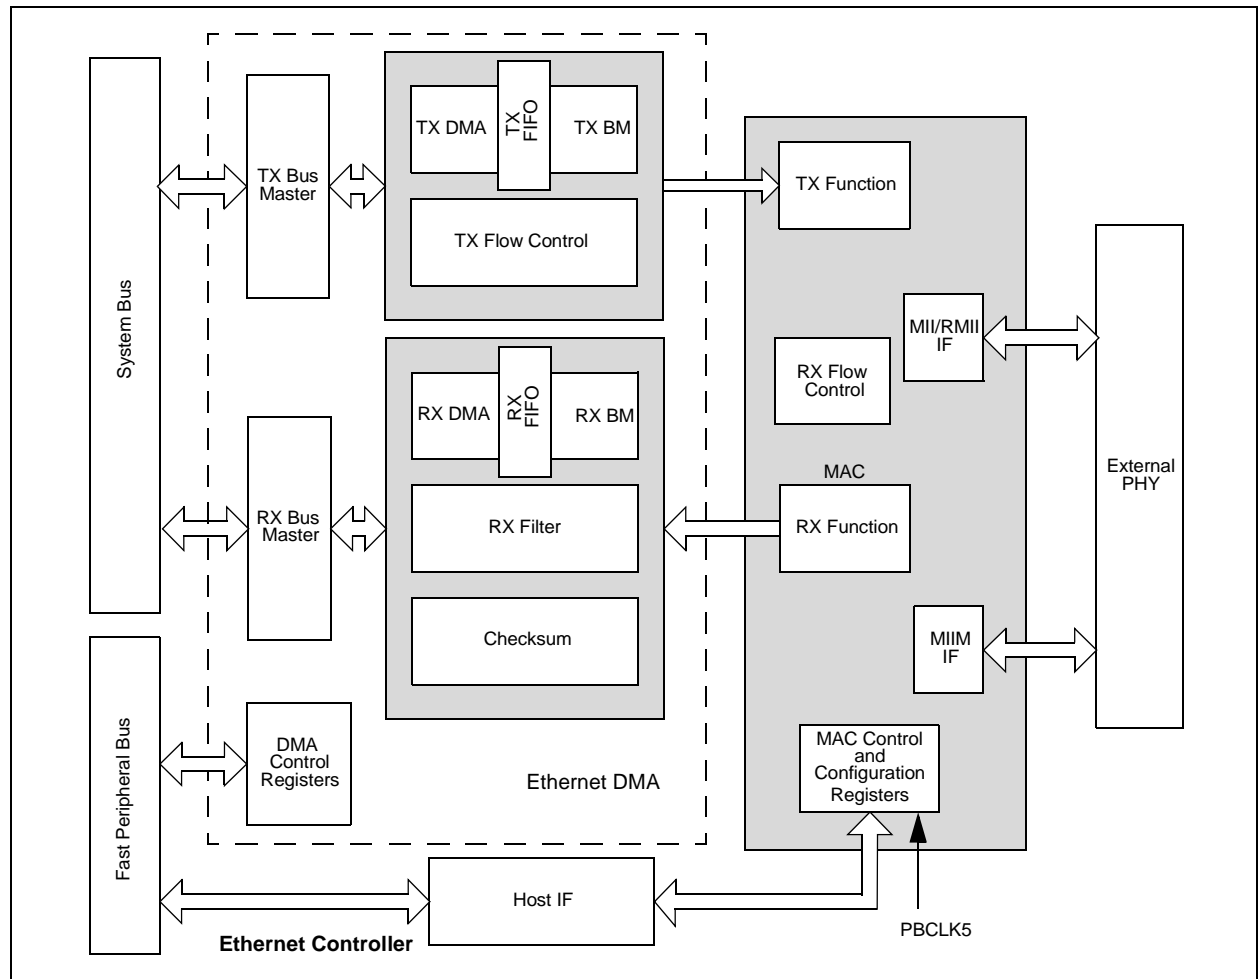

Key features of the Ethernet Controller include:

- Supports 10/100 Mbps data transfer rates
- Supports full-duplex and half-duplex operation

- Supports RMI and MII PHY interface
- Supports MIIM PHY management interface
- Supports both manual and automatic Flow Control
- RAM descriptor-based DMA operation for both receive and transmit path
- Fully configurable interrupts
- Configurable receive packet filtering
  - CRC check
  - 64-byte pattern match
  - Broadcast, multicast and unicast packets
  - Magic Packet™
  - 64-bit hash table
  - Runt packet
- Supports packet payload checksum calculation
- Supports various hardware statistics counters

Figure 30-1 illustrates a block diagram of the Ethernet controller.

**FIGURE 30-1: ETHERNET CONTROLLER BLOCK DIAGRAM**

# PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

## REGISTER 30-11: ETHRXFC: ETHERNET CONTROLLER RECEIVE FILTER CONFIGURATION REGISTER (CONTINUED)

- bit 7     **CRCERREN:** CRC Error Collection Enable bit  
1 = The received packet CRC must be invalid for the packet to be accepted  
0 = Disable CRC Error Collection filtering  
This bit allows the user to collect all packets that have an invalid CRC.
- bit 6     **CRCOKEN:** CRC OK Enable bit  
1 = The received packet CRC must be valid for the packet to be accepted  
0 = Disable CRC filtering  
This bit allows the user to reject all packets that have an invalid CRC.
- bit 5     **RUNTERREN:** Runt Error Collection Enable bit  
1 = The received packet must be a runt packet for the packet to be accepted  
0 = Disable Runt Error Collection filtering  
  
This bit allows the user to collect all packets that are runt packets. For this filter, a runt packet is defined as any packet with a size of less than 64 bytes (when CRCOKEN = 0) or any packet with a size of less than 64 bytes that has a valid CRC (when CRCOKEN = 1).
- bit 4     **RUNTEN:** Runt Enable bit  
1 = The received packet must not be a runt packet for the packet to be accepted  
0 = Disable Runt filtering  
  
This bit allows the user to reject all runt packets. For this filter, a runt packet is defined as any packet with a size of less than 64 bytes.
- bit 3     **UCEN:** Unicast Enable bit  
1 = Enable Unicast Filtering  
0 = Disable Unicast Filtering  
  
This bit allows the user to accept all unicast packets whose Destination Address matches the Station Address.
- bit 2     **NOTMEEN:** Not Me Unicast Enable bit  
1 = Enable Not Me Unicast Filtering  
0 = Disable Not Me Unicast Filtering  
  
This bit allows the user to accept all unicast packets whose Destination Address does not match the Station Address.
- bit 1     **MCEN:** Multicast Enable bit  
1 = Enable Multicast Filtering  
0 = Disable Multicast Filtering  
  
This bit allows the user to accept all Multicast Address packets.
- bit 0     **BCEN:** Broadcast Enable bit  
1 = Enable Broadcast Filtering  
0 = Disable Broadcast Filtering  
  
This bit allows the user to accept all Broadcast Address packets.

- Note 1:** XOR = True when either one or the other conditions are true, but not both.  
**2:** This Hash Table Filter match is active regardless of the value of the HTEN bit.  
**3:** This Magic Packet Filter match is active regardless of the value of the MPEN bit.

- Note 1:** This register is only used for RX operations.  
**2:** The bits in this register may only be changed while the RXEN bit (ETHCON1<8>) = 0.

### Legend:

R = Readable bit

W = Writable bit

U = Unimplemented bit, read as '0'

-n = Value at POR

'1' = Bit is set

'0' = Bit is cleared

x = Bit is unknown

bit 31-15 **Unimplemented:** Read as '0'

bit 14-8 **NB2BIPKTGP1<6:0>:** Non-Back-to-Back Interpacket Gap Part 1 bits

This is a programmable field representing the optional carrierSense window referenced in section 4.2.3.2.1 "Deference" of the IEEE 80.23 Specification. If carrier is detected during the timing of IPGR1, the MAC defers to carrier. If, however, carrier becomes after IPGR1, the MAC continues timing IPGR2 and transmits, knowingly causing a collision, thus ensuring fair access to medium. Its range of values is 0x0 to IPGR2. Its recommend value is 0xC (12d).

bit 7 **Unimplemented:** Read as '0'

bit 6-0 **NB2BIPKTGP2<6:0>:** Non-Back-to-Back Interpacket Gap Part 2 bits

This is a programmable field representing the non-back-to-back Inter-Packet-Gap. Its recommended value is 0x12 (18d), which represents the minimum IPG of 0.96  $\mu$ s (in 100 Mbps) or 9.6  $\mu$ s (in 10 Mbps).

**Note:** Both 16-bit and 32-bit accesses are allowed to these registers (including the SET, CLR and INV registers). 8-bit accesses are not allowed and are ignored by the hardware.

# PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

**REGISTER 34-10: CFGPG: PERMISSION GROUP CONFIGURATION REGISTER**

**Legend:**

R = Readable bit

W = Writable bit

U = Unimplemented bit, read as '0'

-n = Value at POR

'1' = Bit is set

'0' = Bit is cleared

bit 31-26 **Unimplemented:** Read as '0'

bit 25-24 **CRYPTPG<1:0>**: Crypto Engine Permission Group bits

11 = Initiator is assigned to Permission Group 3

10 = Initiator is assigned to Permission Group 2

01 = Initiator is assigned to Permission Group 1

00 = Initiator is assigned to Permission Group 0

bit 23-22 **FCPG<1:0>**: Flash Control Permission Group bits

Same definition as bits 25-24.

bit 21-20 **SQ1PG<1:0>**: SQ1 Module Permission Group bits

Same definition as bits 25-24.

bit 19-18 **Unimplemented:** Read as '0'

bit 17-16 **ETHPG<1:0>**: Ethernet Module Permission Group bits

Same definition as bits 25-24.

bit 15-14 **CAN2PG<1:0>**: CAN2 Module Permission Group bits

Same definition as bits 25-24.

bit 13-12 **CAN1PG<1:0>**: CAN1 Module Permission Group bits

Same definition as bits 25-24.

bit 11-10 **Unimplemented:** Read as '0'

bit 9-8 **USBPG<1:0>**: USB Module Permission Group bits

Same definition as bits 25-24.

bit 7-6 **Unimplemented:** Read as '0'

bit 5-4 **DMPG<1:0>**: DMA Module Permission Group bits

Same definition as bits 25-24.

bit 3-2 **Unimplemented:** Read as '0'

bit 1-0 **CPUPG<1:0>**: CPU Permission Group bits

Same definition as bits 25-24.
