Microchip Technology - PIC32MZ1024EFG144T-I/PL Datasheet

Welcome to E-XFL.COM

What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Active
Core Processor	MIPS32® M-Class
Core Size	32-Bit Single-Core
Speed	200MHz
Connectivity	EBI/EMI, Ethernet, I²C, PMP, SPI, SQI, UART/USART, USB OTG
Peripherals	Brown-out Detect/Reset, DMA, I²S, POR, PWM, WDT
Number of I/O	120
Program Memory Size	1MB (1M x 8)
Program Memory Type	FLASH
EEPROM Size	-
RAM Size	512K x 8
Voltage - Supply (Vcc/Vdd)	2.1V ~ 3.6V
Data Converters	A/D 48x12b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 85°C (TA)
Mounting Type	Surface Mount
Package / Case	144-LQFP
Supplier Device Package	144-LQFP (20x20)

4.0 MEMORY ORGANIZATION

Note: This data sheet summarizes the features of the PIC32MZ EF family of devices. It is not intended to be a comprehensive reference source.For detailed information, refer to **Section 48. "Memory Organization and Permissions"** in the *"PIC32 Family Reference Manual"*, which is available from the Microchip web site (www.microchip.com/PIC32).

PIC32MZ EF microcontrollers provide 4 GB of unified virtual memory address space. All memory regions, including program, data memory, SFRs and Configuration registers, reside in this address space at their respective unique addresses. The program and data memories can be optionally partitioned into user and kernel memories. In addition, PIC32MZ EF devices allow execution from data memory.

Key features include:

- 32-bit native data width
- Separate User (KUSEG) and Kernel (KSEG0/ KSEG1/KSEG2/KSEG3) mode address space
- Separate boot Flash memory for protected code
- Robust bus exception handling to intercept runaway code
- Cacheable (KSEG0/KSEG2) and non-cacheable (KSEG1/KSEG3) address regions
- Read/write permission access to predefined memory regions

4.1 Memory Layout

PIC32MZ EF microcontrollers implement two address schemes: virtual and physical. All hardware resources, such as program memory, data memory and peripherals, are located at their respective physical addresses. Virtual addresses are exclusively used by the CPU to fetch and execute instructions as well as access peripherals. Physical addresses are used by bus master peripherals, such as DMA and the Flash controller, that access memory independently of the CPU.

The main memory maps for the PIC32MZ EF devices are illustrated in Figure 4-1 through Figure 4-4. Figure 4-5 provides memory map information for boot Flash and boot alias. Table 4-1 provides memory map information for Special Function Registers (SFRs).

The default setting is specified by the FPLLMULT<6:0> Configuration bits in the DEVCFG2 register. Refer to Register 34-5 in **Section 34.0 "Special Features"** for information.

bit 15-11 **Unimplemented:** Read as '0'

Note 1: Writes to this register require an unlock sequence. Refer to **Section 42. "Oscillators with Enhanced PLL"** (DS60001250) in the *"PIC32 Family Reference Manual"* for details.

2: Writes to this register are not allowed if the SPLL is selected as a clock source (COSC<2:0> = 001).

REGISTER 10-7: DCHxCON: DMA CHANNEL x CONTROL REGISTER (CONTINUED)

bit 4 **CHAEN:** Channel Automatic Enable bit
1 = Channel is continuously enabled, and not automatically disabled after a block transfer is complete
0 = Channel is disabled on block transfer complete

bit 3 **Unimplemented:** Read as '0'

bit 2 **CHEDET:** Channel Event Detected bit
1 = An event has been detected
0 = No events have been detected

bit 1-0 **CHPRI<1:0>:** Channel Priority bits
11 = Channel has priority 3 (highest)
10 = Channel has priority 2
01 = Channel has priority 1
00 = Channel has priority 0

Note 1: The chain selection bit takes effect when chaining is enabled (i.e., CHCHN = 1).

2: When the channel is suspended by clearing this bit, the user application should poll the CHBUSY bit (if available on the device variant) to see when the channel is suspended, as it may take some clock cycles to complete a current transaction before the channel is suspended.

NOTES:

26.0 CRYPTO ENGINE

Note: This data sheet summarizes the features of the PIC32MZ EF family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 49. "Crypto Engine (CE) and Random Number Generator (RNG)"** (DS60001246) in the *"PIC32 Family Reference Manual"*, which is available from the Microchip web site (www.microchip.com/PIC32).

The Crypto Engine is intended to accelerate applications that need cryptographic functions. By executing these functions in the hardware module, software overhead is reduced and actions, such as encryption, decryption, and authentication can execute much more quickly.

The Crypto Engine uses an internal descriptor-based DMA for efficient programming of the security association data and packet pointers (allowing scatter/gather data fetching). An intelligent state machine schedules the Crypto Engines based on the protocol selection and packet boundaries. The hardware engines can perform the encryption and authentication in sequence or in parallel.

The following are key features of the Crypto Engine:

- Bulk ciphers and hash engines
- Integrated DMA to off-load processing:
  - Buffer descriptor-based
  - Secure association per buffer descriptor
- Some functions can execute in parallel

Bulk ciphers that are handled by the Crypto Engine include:

- AES:
  - 128-bit, 192-bit, and 256-bit key sizes
  - CBC, ECB, CTR, CFB, and OFB modes
- DES/TDES:
  - CBC, ECB, CFB, and OFB modes

Authentication engines that are available through the Crypto Engine include:

- SHA-1
- SHA-256
- MD-5
- AES-GCM
- HMAC operation (for all authentication engines)

The rate of data that can be processed by the Crypto Engine depends on these factors:

- Which engine is in use
- Whether the engines are used in parallel or in series
- The demands on source and destination memories by other parts of the system (i.e., CPU, DMA, etc.)
- The speed of PBCLK5, which drives the Crypto Engine

Table 26-1 shows typical performance for various engines.

33.3 Peripheral Module Disable

The Peripheral Module Disable (PMD) registers provide a method to disable a peripheral module by stopping all clock sources supplied to that module. When a peripheral is disabled using the appropriate PMD control bit, the peripheral is in a minimum power consumption state. The control and status registers associated with the peripheral are also disabled, so writes to those registers do not have effect and read values are invalid.

To disable a peripheral, the associated PMDx bit must be set to '1'. To enable a peripheral, the associated PMDx bit must be cleared (default). See Table 33-1 for more information.

Note:	Disabling a peripheral module while it's ON bit is set, may result in undefined behavior. The ON bit for the associated peripheral module must be cleared prior to disable a module via the PMDx bits.

APPENDIX A: MIGRATING FROM PIC32MX5XX/6XX/7XX TO PIC32MZ EF

This appendix provides an overview of considerations for migrating from PIC32MX5XX/6XX/7XX devices to the PIC32MZ EF family of devices. The code developed for PIC32MX5XX/6XX/7XX devices can be ported to PIC32MZ EF devices after making the appropriate changes outlined in the following sections.

The PIC32MZ EF devices are based on a new architecture, and feature many improvements and new capabilities over PIC32MX5XX/6XX/7XX devices.

A.1 Oscillator and PLL Configuration

Because the maximum speed of the PIC32MZ EF family is greater, the configuration of the oscillator is different from prior PIC32MX5XX/6XX/7XX devices.

Table A-1 summarizes the differences (indicated by **Bold** type) between the family devices for the oscillator.

TABLE A-1: OSCILLATOR CONFIGURATION DIFFERENCES

PIC32MX5XX/6XX/7XX Feature	PIC32MZ EF Feature
Primary Oscillator Configuration	
On PIC32MX devices, XT mode had to be selected if the input frequency was in the 3 MHz to 10 MHz range (4-10 for PLL), and HS mode had to be selected if the input frequency was in the 10 MHz to 20 MHz range.	On PIC32MZ EF devices, HS mode has a wider input frequency range (4 MHz to 12 MHz). The bit setting of '01' is Reserved.
POSCMOD<1:0> (DEVCFG1<9:8>) 11 = Primary Oscillator disabled 10 = HS Oscillator mode selected **01 = XT Oscillator mode selected** 00 = External Clock mode selected	POSCMOD<1:0> (DEVCFG1<9:8>) 11 = Primary Oscillator disabled 10 = HS Oscillator mode selected **01 = Reserved** 00 = External Clock mode selected
On PIC32MX devices, crystal mode could be selected with the HS or XT POSC setting, but an external oscillator could be fed into the OSC1/CLKI pin and the part would operate normally.	On PIC32MZ devices, this option is not available. External oscillator signals should only be fed into the OSC1/CLKI pin with the POSC set to EC mode.
Oscillator Selection	
On PIC32MX devices, clock selection choices are as follows:	On PIC32MZ EF devices, clock selection choices are as follows:
FNOSC<2:0> (DEVCFG1<2:0>) NOSC<2:0> (OSCCON<10:8>) 111 = FRCDIV **110 = FRCDIV16** 101 = LPRC 100 = SOSC **011 = POSC with PLL module** 010 = POSC (XT, HS, EC) **001 = FRCDIV+PLL** **000 = FRC**	FNOSC<2:0> (DEVCFG1<2:0>) NOSC<2:0> (OSCCON<10:8>) 111 = FRCDIV **110 = Reserved** 101 = LPRC 100 = SOSC **011 = Reserved** 010 = POSC (HS or EC) **001 = System PLL (SPLL)** **000 = FRCDIV**
