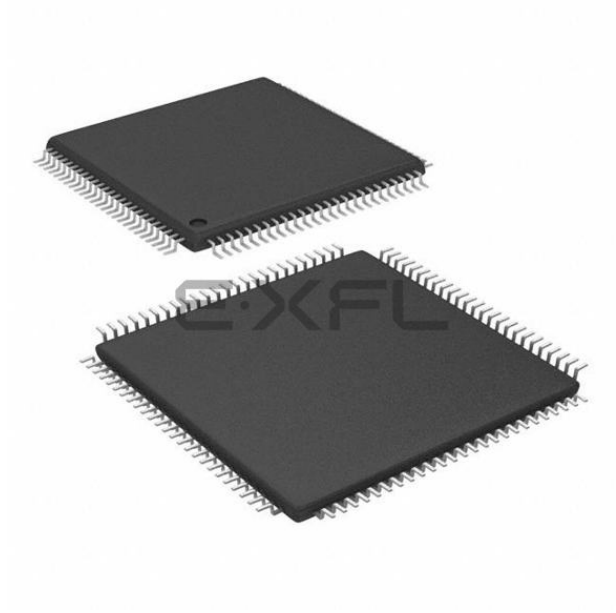
Microchip Technology - PIC32MZ1024EFH100-I/PF Datasheet



Welcome to E-XFL.COM

What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Active
Core Processor	MIPS32® M-Class
Core Size	32-Bit Single-Core
Speed	200MHz
Connectivity	CANbus, EBI/EMI, Ethernet, I²C, PMP, SPI, SQI, UART/USART, USB OTG
Peripherals	Brown-out Detect/Reset, DMA, I²S, POR, PWM, WDT
Number of I/O	78
Program Memory Size	1MB (1M x 8)
Program Memory Type	FLASH
EEPROM Size	-
RAM Size	512K x 8
Voltage - Supply (Vcc/Vdd)	2.1V ~ 3.6V
Data Converters	A/D 40x12b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 85°C (TA)
Mounting Type	Surface Mount
Package / Case	100-TQFP
Supplier Device Package	100-TQFP (14x14)
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/pic32mz1024efh100-i-pf

The FPU implements a high-performance 7-stage pipeline:

- Decode, register read and unpack (FR stage)
- Multiply tree, double pumped for double (M1 stage)
- Multiply complete (M2 stage)
- Addition first step (A1 stage)
- Addition second and final step (A2 stage)
- Packing to IEEE format (FP stage)
- Register writeback (FW stage)

The FPU implements a bypass mechanism that allows the result of an operation to be forwarded directly to the instruction that needs it without having to write the result to the FPU register and then read it back.

Table 3-5 lists the Coprocessor 1 Registers for the FPU.

TABLE 3-5: FPU (CP1) REGISTERS

Register Number	Register Name	Function
0	FIR	Floating Point implementation register. Contains information that identifies the FPU.
25	FCCR	Floating Point condition codes register.
26	FEXR	Floating Point exceptions register.
28	FENR	Floating Point enables register.
31	FCSR	Floating Point Control and Status register.

3.2 Power Management

The processor core offers a number of power management features, including low-power design, active power management and power-down modes of operation. The core is a static design that supports slowing or halting the clocks, which reduces system power consumption during Idle periods.

3.2.1 INSTRUCTION-CONTROLLED POWER MANAGEMENT

The mechanism for invoking Power-Down mode is through execution of the `WAIT` instruction. For more information on power management, see **Section 33.0 "Power-Saving Features"**.

3.2.2 LOCAL CLOCK GATING

The majority of the power consumed by the processor core is in the clock tree and clocking registers. The PIC32MZ family makes extensive use of local gated-clocks to reduce this dynamic power consumption.

3.3 L1 Instruction and Data Caches

3.3.1 INSTRUCTION CACHE (I-CACHE)

The I-Cache is an on-core memory block of 16 Kbytes. Because the I-Cache is virtually indexed, the virtual-to-physical address translation occurs in parallel with the cache access rather than having to wait for the physical address translation. The tag holds 22 bits of physical address, a valid bit, and a lock bit. The LRU replacement bits are stored in a separate array.

The I-Cache block also contains and manages the instruction line fill buffer. Besides accumulating data to be written to the cache, instruction fetches that reference data in the line fill buffer are serviced either by a bypass of that data, or data coming from the external interface. The I-Cache control logic controls the bypass function.

The processor core supports I-Cache locking. Cache locking allows critical code or data segments to be locked into the cache on a per-line basis, enabling the system programmer to maximize the efficiency of the system cache.

The cache locking function is always available on all I-Cache entries. Entries can then be marked as locked or unlocked on a per entry basis using the `CACHE` instruction.

3.3.2 DATA CACHE (D-CACHE)

The D-Cache is an on-core memory block of 4 Kbytes. This virtually indexed, physically tagged cache is protected. Because the D-Cache is virtually indexed, the virtual-to-physical address translation occurs in parallel with the cache access. The tag holds 22 bits of physical address, a valid bit, and a lock bit. There is an additional array holding dirty bits and LRU replacement algorithm bits for each set of the cache.

In addition to I-Cache locking, the processor core also supports a D-Cache locking mechanism identical to the I-Cache. Critical data segments are locked into the cache on a per-line basis. The locked contents can be updated on a store hit, but cannot be selected for replacement on a cache miss.

The D-Cache locking function is always available on all D-Cache entries. Entries can then be marked as locked or unlocked on a per-entry basis using the `CACHE` instruction.

3.3.3 ATTRIBUTES

The processor core I-Cache and D-Cache attributes are listed in the Configuration registers (see Register 3-1 through Register 3-4).

The System Bus arbitration scheme implements a non-programmable, Least Recently Serviced (LRS) priority, which provides Quality Of Service (QOS) for most initiators. However, some initiators can use Fixed High Priority (HIGH) arbitration to guarantee their access to data.

The arbitration scheme for the available initiators is shown in Table 4-5.

TABLE 4-5: INITIATOR ID AND QOS

Name	ID	QOS
CPU	1	LRS(1)
CPU	2	HIGH(1,2)
DMA Read	3	LRS(1)
DMA Read	4	HIGH(1,2)
DMA Write	5	LRS(1)
DMA Write	6	HIGH(1,2)
USB	7	LRS
Ethernet Read	8	LRS
Ethernet Write	9	LRS
CAN1	10	LRS
CAN2	11	LRS
SQI1	12	LRS
Flash Controller	13	HIGH(2)
Crypto	14	LRS

Note 1: When accessing SRAM, the DMAPRI bit (CFGCON<25>) and the CPUPRI bit (CFGCON<24>) provide arbitration control for the DMA and CPU (when servicing an interrupt (i.e., EXL = 1)), respectively, by selecting the use of LRS or HIGH When using HIGH, the DMA and CPU get arbitration preference over all initiators using LRS.

2: Using HIGH arbitration can have serious negative effects on other initiators. Therefore, it is recommended to not enable this type of arbitration for an initiator that uses significant system bandwidth. HIGH arbitration is intended to be used for low bandwidth applications that require low latency, such as LCC graphics applications.

4.3 Permission Access and System Bus Registers

The System Bus on PIC32MZ EF family of microcontrollers provides access control capabilities for the transaction initiators on the System Bus.

The System Bus divides the entire memory space into fourteen target regions and permits access to each target by initiators via permission groups. Four Permission Groups (0 through 3) can be assigned to each initiator. Each permission group is independent of the others and can have exclusive or shared access to a region.

Using the CFGPG register (see Register 34-10 in **Section 34.0 “Special Features”**), Boot firmware can assign a permission group to each initiator, which can make requests on the System Bus.

The available targets and their regions, as well as the associated control registers to assign protection, are described and listed in Table 4-6.

Register 4-2 through Register 4-10 are used for setting and controlling access permission groups and regions.

To change these registers, they must be unlocked in hardware. The register lock is controlled by the PGLOCK Configuration bit (CFGCON<11>). Setting PGLOCK prevents writes to the control registers; clearing PGLOCK allows writes.

To set or clear the PGLOCK bit, an unlock sequence must be executed. Refer to **Section 42. “Oscillators with Enhanced PLL”** in the *“PIC32 Family Reference Manual”* for details.

REGISTER 5-1: NVMCON: FLASH PROGRAMMING CONTROL REGISTER (CONTINUED)

bit 6 **BFSWAP:** Boot Flash Bank Alias Swap Control bit

This bit is only writable when WREN = 0 and the unlock sequence has been performed.

1 = Boot Flash Bank 2 is mapped to the lower boot alias and boot Flash Bank 1 is mapped to the upper boot alias

0 = Boot Flash Bank 1 is mapped to the lower boot alias and boot Flash Bank 2 is mapped to the upper boot alias

bit 5-4 **Unimplemented:** Read as '0'

bit 3-0 **NVMOP<3:0>:** NVM Operation bits

These bits are only writable when WREN = 0.

1111 = Reserved

•

•

•

1000 = Reserved

0111 = Program erase operation: erase all of program Flash memory (all pages must be unprotected, PWP<23:0> = 0x000000)

0110 = Upper program Flash memory erase operation: erases only the upper mapped region of program Flash (all pages in that region must be unprotected)

0101 = Lower program Flash memory erase operation: erases only the lower mapped region of program Flash (all pages in that region must be unprotected)

0100 = Page erase operation: erases page selected by NVMADDR, if it is not write-protected

0011 = Row program operation: programs row selected by NVMADDR, if it is not write-protected

0010 = Quad Word (128-bit) program operation: programs the 128-bit Flash word selected by NVMADDR, if it is not write-protected

0001 = Word program operation: programs word selected by NVMADDR, if it is not write-protected**(2)**

0000 = No operation

Note 1: These bits are only reset by a Power-on Reset (POR) and are not affected by other reset sources.

2: This operation results in a "no operation" (NOP) when the Dynamic Flash ECC Configuration bits = 00 (FECCCON<1:0> (DVCFG0<9:8>)), which enables ECC at all times. For all other FECCCON<1:0> bit settings, this command will execute, but will not write the ECC bits for the word and can cause DED errors if dynamic Flash ECC is enabled (FECCCON<1:0> = 01). Refer to **Section 52. "Flash Program Memory with Support for Live Update"** (DS60001193) for information regarding ECC and Flash programming.

6.1 Reset Control Registers

TABLE 6-1: RESETS REGISTER MAP

Virtual Address (BF80_#)	Register Name(1)	Bit Range	Bits																All Resets
			31/15	30/14	29/13	28/12	27/11	26/10	25/9	24/8	23/7	22/6	21/5	20/4	19/3	18/2	17/1	16/0

Legend: x = unknown value on Reset; — = unimplemented, read as '0'. Reset values are shown in hexadecimal.

Note 1: All registers in this table with the exception of the OFFx registers, have corresponding CLR, SET, and INV registers at their virtual addresses, plus offsets of 0x4, 0x8 and 0xC, respectively. See **Section 12.3 "CLR, SET, and INV Registers"** for more information.
2: This bit or register is not available on 64-pin devices.
3: This bit or register is not available on devices without a CAN module.
4: This bit or register is not available on 100-pin devices.
5: Bits 31 and 30 are not available on 64-pin and 100-pin devices; bits 29 through 14 are not available on 64-pin devices.
6: Bits 31, 30, 29, and bits 5 through 0 are not available on 64-pin and 100-pin devices; bit 31 is not available on 124-pin devices; bit 22 is not available on 64-pin devices.
7: This bit or register is not available on devices without a Crypto module.
8: This bit or register is not available on 124-pin devices.

TABLE 8-2: OSCILLATOR CONFIGURATION REGISTER MAP (CONTINUED)

Virtual Address (BF80_#)	Register Name(1)	Bit Range	Bits																All Resets(2)
			31/15	30/14	29/13	28/12	27/11	26/10	25/9	24/8	23/7	22/6	21/5	20/4	19/3	18/2	17/1	16/0

R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31-16 **CVDDATA<15:0>:** CVD Data Status bits

In CVD mode, these bits obtain the CVD differential output data (subtraction of CVD positive and negative measurement), whenever a Digital Comparator interrupt is generated. The value in these bits is compliant with the FRACT bit (ADCCON1<23>) and is always signed.

bit 15-14 **Unimplemented:** Read as '0'

bit 13-8 **AINID<5:0>:** Digital Comparator 0 Analog Input Identification (ID) bits

When a digital comparator event occurs (DCMPED = 1), these bits identify the analog input being monitored by Digital Comparator 0.

Note: In normal ADC mode, only analog inputs <31:0> can be processed by the Digital Comparator 0. The Digital Comparator 0 also supports the CVD mode, in which all Class 2 and Class 3 analog inputs may be stored in the AINID<5:0> bits.

111111 = Reserved

•
•
101101 = Reserved
101100 = AN44 is being monitored
101011 = AN43 is being monitored
•
•
•
000001 = AN1 is being monitored
000000 = AN0 is being monitored

bit 7 **ENDCMP:** Digital Comparator 0 Enable bit

1 = Digital Comparator 0 is enabled

0 = Digital Comparator 0 is not enabled, and the DCMPED status bit (ADCCMP0CON<5>) is cleared

bit 6 **DCMPGIEN:** Digital Comparator 0 Global Interrupt Enable bit

1 = A Digital Comparator 0 interrupt is generated when the DCMPED status bit (ADCCMP0CON<5>) is set

0 = A Digital Comparator 0 interrupt is disabled

bit 5 **DCMPED:** Digital Comparator 0 "Output True" Event Status bit

The logical conditions under which the digital comparator gets "True" are defined by the IEBTWN, IEHIHI, IEHILO, IELOHI, and IELOLO bits.

Note: This bit is cleared by reading the AINID<5:0> bits or by disabling the Digital Comparator module (by setting ENDCMP to '0').

1 = Digital Comparator 0 output true event has occurred (output of Comparator is '1')

0 = Digital Comparator 0 output is false (output of comparator is '0')

bit 4 **IEBTWN:** Between Low/High Digital Comparator 0 Event bit

1 = Generate a digital comparator event when DCMPLO<15:0> ≤ DATA<31:0> < DCMPHI<15:0>

0 = Do not generate a digital comparator event

These bits reflect the system configuration and are updated during boot-up time. By reading these read-only bits, the user application can determine whether or not an analog input in the device is available.

AN<63:32>: Reflects the presence or absence of the respective analog input (AN63-AN32).

REGISTER 29-21: CiFIFOINTn: CAN FIFO INTERRUPT REGISTER 'n' ('n' = 0-31)

Bit Range	Bit 31/23/15/7	Bit 30/22/14/6	Bit 29/21/13/5	Bit 28/20/12/4	Bit 27/19/11/3	Bit 26/18/10/2	Bit 25/17/9/1	Bit 24/16/8/0

	—	—	—	—	RXOVFLIF	RXFULLIF(1)	RXHALFIF(1)	RXNEMPTYIF(1)

Legend:			
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31-27 **Unimplemented:** Read as '0'

bit 26 **TXNFULLIE:** Transmit FIFO Not Full Interrupt Enable bit
1 = Interrupt enabled for FIFO not full
0 = Interrupt disabled for FIFO not full

bit 25 **TXHALFIE:** Transmit FIFO Half Full Interrupt Enable bit
1 = Interrupt enabled for FIFO half full
0 = Interrupt disabled for FIFO half full

bit 24 **TXEMPTYIE:** Transmit FIFO Empty Interrupt Enable bit
1 = Interrupt enabled for FIFO empty
0 = Interrupt disabled for FIFO empty

bit 23-20 **Unimplemented:** Read as '0'

bit 19 **RXOVFLIE:** Overflow Interrupt Enable bit
1 = Interrupt enabled for overflow event
0 = Interrupt disabled for overflow event

bit 18 **RXFULLIE:** Full Interrupt Enable bit
1 = Interrupt enabled for FIFO full
0 = Interrupt disabled for FIFO full

bit 17 **RXHALFIE:** FIFO Half Full Interrupt Enable bit
1 = Interrupt enabled for FIFO half full
0 = Interrupt disabled for FIFO half full

bit 16 **RXNEMPTYIE:** Empty Interrupt Enable bit
1 = Interrupt enabled for FIFO not empty
0 = Interrupt disabled for FIFO not empty

bit 15-11 **Unimplemented:** Read as '0'

bit 10 **TXNFULLIF:** Transmit FIFO Not Full Interrupt Flag bit(1)
TXEN = 1: (FIFO configured as a Transmit Buffer)
1 = FIFO is not full
0 = FIFO is full
TXEN = 0: (FIFO configured as a Receive Buffer)
Unused, reads '0'

Note 1: This bit is read-only and reflects the status of the FIFO.

REGISTER 34-3: DEVCFG0/ADEVCFG0: DEVICE CONFIGURATION WORD 0

Bit Range	Bit 31/23/15/7	Bit 30/22/14/6	Bit 29/21/13/5	Bit 28/20/12/4	Bit 27/19/11/3	Bit 26/18/10/2	Bit 25/17/9/1	Bit 24/16/8/0

	—	EJTAGBEN	—	—	—	—	—	—
23:16	r-1	r-1	R/P	R/P	R/P	R/P	R/P	R/P
	—	—	POSCBOOST	POSCGAIN<1:0>		SOSCBOOST	SOSCGAIN<1:0>	
15:8	R/P	R/P	R/P	R/P	r-y	R/P	R/P	R/P
	SMCLR	DBGPER<2:0>			—	FSLEEP	FECCCON<1:0>	
7:0	r-1	R/P	R/P	R/P	R/P	R/P	R/P	R/P
	—	BOOTISA	TRCEN	ICESEL<1:0>		JTAGEN(1)	DEBUG<1:0>	

Legend:	r = Reserved bit	y = Value set from Configuration bits on POR	
R = Readable bit	P = Programmable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31 **Reserved:** The reset value of this bit is the same as DEVSIGN0<31>.

bit 30 **EJTAGBEN:** EJTAG Boot Enable bit
- 1 = Normal EJTAG functionality
- 0 = Reduced EJTAG functionality

bit 29-22 **Reserved:** Write as '1'

bit 21 **POSCBOOST:** Primary Oscillator Boost Kick Start Enable bit
- 1 = Boost the kick start of the oscillator
- 0 = Normal start of the oscillator

bit 20-19 **POSCGAIN<1:0>:** Primary Oscillator Gain Control bits
- 11 = Gain Level 3 (highest)
- 10 = Gain Level 2
- 01 = Gain Level 1
- 00 = Gain Level 0 (lowest)

bit 18 **SOSCBOOST:** Secondary Oscillator Boost Kick Start Enable bit
- 1 = Boost the kick start of the oscillator
- 0 = Normal start of the oscillator

bit 17-16 **SOSCGAIN<1:0>:** Secondary Oscillator Gain Control bits
- 11 = Gain Level 3 (highest)
- 10 = Gain Level 2
- 01 = Gain Level 1
- 00 = Gain Level 0 (lowest)

bit 15 **SMCLR:** Soft Master Clear Enable bit
- 1 = $\overline{\text{MCLR}}$ pin generates a normal system Reset
- 0 = $\overline{\text{MCLR}}$ pin generates a POR Reset

bit 14-12 **DBGPER<2:0>:** Debug Mode CPU Access Permission bits
- 1xx = Allow CPU access to Permission Group 2 permission regions
- x1x = Allow CPU access to Permission Group 1 permission regions
- xx1 = Allow CPU access to Permission Group 0 permission regions
- 0xx = Deny CPU access to Permission Group 2 permission regions
- x0x = Deny CPU access to Permission Group 1 permission regions
- xx0 = Deny CPU access to Permission Group 0 permission regions

When the CPU is in Debug mode and the CPU1PG<1:0> bits (CFGPG<1:0>) are set to a denied permission group as defined by DBGPER<2:0>, the transaction request is assigned Group 3 permissions.

bit 11 **Reserved:** This bit is controlled by debugger/emulator development tools and should not be modified by the user.

Note 1: This bit sets the value of the JTAGEN bit in the CFGCON register.

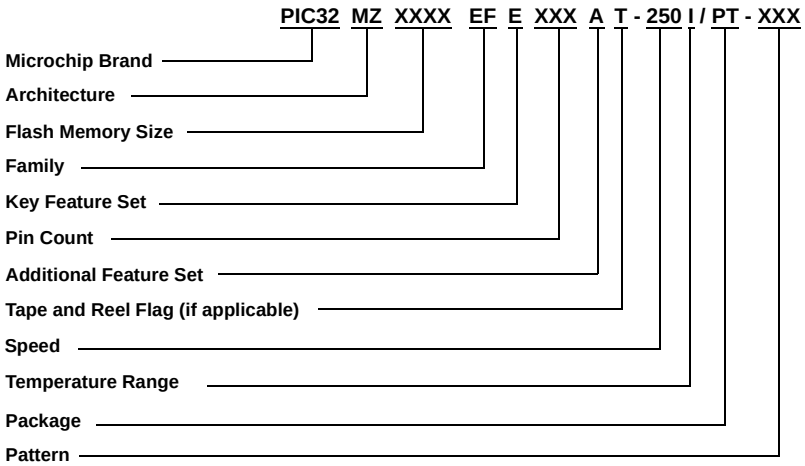
TABLE 39-4: DC CHARACTERISTICS: PROGRAM FLASH MEMORY WAIT STATES

DC CHARACTERISTICS	Standard Operating Conditions: 2.1V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial		
Required Flash Wait States(1)	**SYSCLK**	**Units**	**Conditions**
With ECC:			
0 Wait states	0 < SYSCLK ≤ 60	MHz	—
1 Wait state	60 < SYSCLK ≤ 120		
2 Wait states	120 < SYSCLK ≤ 200		
4 Wait states	200 < SYSCLK ≤ 252		
Without ECC:			
0 Wait states	0 < SYSCLK ≤ 74	MHz	—
1 Wait state	74 < SYSCLK ≤ 140		
2 Wait states	140 < SYSCLK ≤ 200		
4 Wait states	200 < SYSCLK ≤ 252		

Note 1: To use Wait states, the Prefetch module must be enabled (PREFEN<1:0> ≠ 00) and the PFMWS<2:0> bits must be written with the desired Wait state value.

PRODUCT IDENTIFICATION SYSTEM

To order or obtain information, e.g., on pricing or delivery, refer to the factory or the listed sales office.



Example:

PIC32MZ2048EFH144-I/PT:
Embedded Connectivity PIC32,
MIPS32® M-Class MPU core,
2048 KB program memory,
144-pin, with Floating Point Unit,
Industrial temperature, TQFP package.

Flash Memory Family

Architecture	MZ	= MIPS32® M-Class MPU Core
Flash Memory Size	0512	= 512 KB
	1024	= 1024 KB
	2048	= 2048 KB
Family	EF	= Embedded Connectivity Microcontroller Family with Floating Point Unit
Key Feature	E	= PIC32 EF Family Features (no CAN, no Crypto)
	F	= PIC32 EF Family Features (CAN, no Crypto)
	G	= PIC32 EF Family Features (no CAN, no Crypto)
	H	= PIC32 EF Family Features (CAN, no Crypto)
	K	= PIC32 EF Family Features (Crypto and CAN)
	M	= PIC32 EF Family Features (Crypto and CAN)
Pin Count	064	= 64-pin
	100	= 100-pin
	124	= 124-pin
	144	= 144-pin
Speed	Blank	= Up to 200 MHz
	250	= Up to 252 MHz
Temperature Range	I	= -40°C to +85°C (Industrial)
	E	= -40°C to +125°C (Extended)
Package	MR	= 64-Lead (9x9x0.9 mm) QFN (Plastic Quad Flatpack)
	PT	= 64-Lead (10x10x1 mm) TQFP (Thin Quad Flatpack)
	PT	= 100-Lead (12x12x1 mm) TQFP (Thin Quad Flatpack)
	PF	= 100-Lead (14x14x1 mm) TQFP (Thin Quad Flatpack)
	TL	= 124-Lead (9x9x0.9 mm) VTLA (Very Thin Leadless Array)
	PH	= 144-Lead (16x16x1 mm) TQFP (Thin Quad Flatpack)
	PL	= 144-Lead (20x20x1.40 mm) LQFP (Low Profile Quad Flatpack)
Pattern		Three-digit QTP, SQTP, Code or Special Requirements (blank otherwise)
	ES	= Engineering Sample
