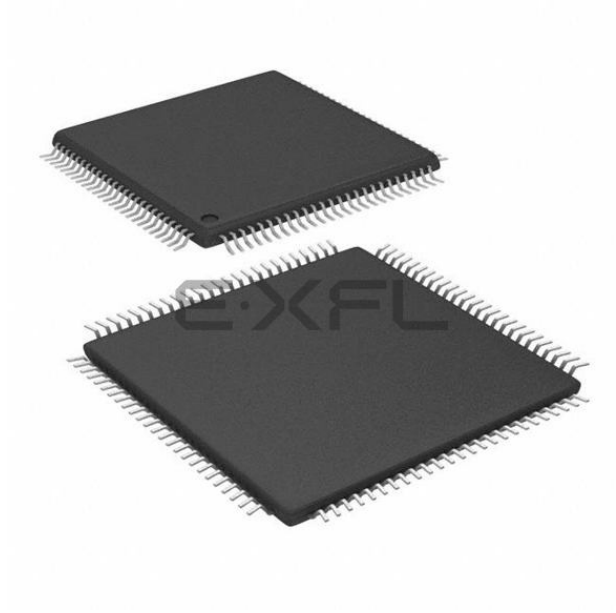
Microchip Technology - PIC32MZ2048EFG100-E/PT Datasheet



Welcome to E-XFL.COM

What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Active
Core Processor	MIPS32® M-Class
Core Size	32-Bit Single-Core
Speed	180MHz
Connectivity	EBI/EMI, Ethernet, I²C, PMP, SPI, SQI, UART/USART, USB OTG
Peripherals	Brown-out Detect/Reset, DMA, I²S, POR, PWM, WDT
Number of I/O	78
Program Memory Size	2MB (2M x 8)
Program Memory Type	FLASH
EEPROM Size	-
RAM Size	512K x 8
Voltage - Supply (Vcc/Vdd)	2.1V ~ 3.6V
Data Converters	A/D 40x12b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 125°C
Mounting Type	Surface Mount
Package / Case	100-TQFP
Supplier Device Package	100-TQFP (12x12)
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/pic32mz2048efg100-e-pt

The FPU implements a high-performance 7-stage pipeline:

- Decode, register read and unpack (FR stage)
- Multiply tree, double pumped for double (M1 stage)
- Multiply complete (M2 stage)
- Addition first step (A1 stage)
- Addition second and final step (A2 stage)
- Packing to IEEE format (FP stage)
- Register writeback (FW stage)

The FPU implements a bypass mechanism that allows the result of an operation to be forwarded directly to the instruction that needs it without having to write the result to the FPU register and then read it back.

Table 3-5 lists the Coprocessor 1 Registers for the FPU.

TABLE 3-5: FPU (CP1) REGISTERS

Register Number	Register Name	Function
0	FIR	Floating Point implementation register. Contains information that identifies the FPU.
25	FCCR	Floating Point condition codes register.
26	FEXR	Floating Point exceptions register.
28	FENR	Floating Point enables register.
31	FCSR	Floating Point Control and Status register.

3.2 Power Management

The processor core offers a number of power management features, including low-power design, active power management and power-down modes of operation. The core is a static design that supports slowing or halting the clocks, which reduces system power consumption during Idle periods.

3.2.1 INSTRUCTION-CONTROLLED POWER MANAGEMENT

The mechanism for invoking Power-Down mode is through execution of the `WAIT` instruction. For more information on power management, see **Section 33.0 "Power-Saving Features"**.

3.2.2 LOCAL CLOCK GATING

The majority of the power consumed by the processor core is in the clock tree and clocking registers. The PIC32MZ family makes extensive use of local gated-clocks to reduce this dynamic power consumption.

3.3 L1 Instruction and Data Caches

3.3.1 INSTRUCTION CACHE (I-CACHE)

The I-Cache is an on-core memory block of 16 Kbytes. Because the I-Cache is virtually indexed, the virtual-to-physical address translation occurs in parallel with the cache access rather than having to wait for the physical address translation. The tag holds 22 bits of physical address, a valid bit, and a lock bit. The LRU replacement bits are stored in a separate array.

The I-Cache block also contains and manages the instruction line fill buffer. Besides accumulating data to be written to the cache, instruction fetches that reference data in the line fill buffer are serviced either by a bypass of that data, or data coming from the external interface. The I-Cache control logic controls the bypass function.

The processor core supports I-Cache locking. Cache locking allows critical code or data segments to be locked into the cache on a per-line basis, enabling the system programmer to maximize the efficiency of the system cache.

The cache locking function is always available on all I-Cache entries. Entries can then be marked as locked or unlocked on a per entry basis using the `CACHE` instruction.

3.3.2 DATA CACHE (D-CACHE)

The D-Cache is an on-core memory block of 4 Kbytes. This virtually indexed, physically tagged cache is protected. Because the D-Cache is virtually indexed, the virtual-to-physical address translation occurs in parallel with the cache access. The tag holds 22 bits of physical address, a valid bit, and a lock bit. There is an additional array holding dirty bits and LRU replacement algorithm bits for each set of the cache.

In addition to I-Cache locking, the processor core also supports a D-Cache locking mechanism identical to the I-Cache. Critical data segments are locked into the cache on a per-line basis. The locked contents can be updated on a store hit, but cannot be selected for replacement on a cache miss.

The D-Cache locking function is always available on all D-Cache entries. Entries can then be marked as locked or unlocked on a per-entry basis using the `CACHE` instruction.

3.3.3 ATTRIBUTES

The processor core I-Cache and D-Cache attributes are listed in the Configuration registers (see Register 3-1 through Register 3-4).

TABLE 4-14: SYSTEM BUS TARGET 6 REGISTER MAP

Virtual Address (BF8F_#)	Register Name	Bit Range	Bits																All Resets

	—					PLLIDIV<2:0>		
7:0	R/W-y	U-0	U-0	U-0	U-0	R/W-y	R/W-y	R/W-y
	PLLICLK	—	—	—	—	PLLRANGE<2:0>		

Legend:	y = Value set from Configuration bits on POR		
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31-27 **Unimplemented:** Read as '0'

bit 26-24 **PLLODIV<2:0>:** System PLL Output Clock Divider bits

111 = Reserved
110 = Reserved
101 = PLL Divide by 32
100 = PLL Divide by 16
011 = PLL Divide by 8
010 = PLL Divide by 4
001 = PLL Divide by 2
000 = Reserved

The default setting is specified by the FPLLODIV<2:0> Configuration bits in the DEVCFG2 register. Refer to Register 34-5 in **Section 34.0 "Special Features"** for information.

bit 23 **Unimplemented:** Read as '0'

bit 22-16 **PLLMULT<6:0>:** System PLL Multiplier bits

1111111 = Multiply by 128
1111110 = Multiply by 127
1111101 = Multiply by 126
1111100 = Multiply by 125
•
•
•
0000000 = Multiply by 1

The default setting is specified by the FPLLMULT<6:0> Configuration bits in the DEVCFG2 register. Refer to Register 34-5 in **Section 34.0 "Special Features"** for information.

bit 15-11 **Unimplemented:** Read as '0'

Note 1: Writes to this register require an unlock sequence. Refer to **Section 42. "Oscillators with Enhanced PLL"** (DS60001250) in the *"PIC32 Family Reference Manual"* for details.

2: Writes to this register are not allowed if the SPLL is selected as a clock source (COSC<2:0> = 001).

REGISTER 11-28: USBLPMR1: USB LINK POWER MANAGEMENT CONTROL REGISTER 1 (CONTINUED)

bit 16 **LPMXMT:** LPM Transition to the L1 State bit

When in *Device mode*:

1 = USB module will transition to the L1 state upon the receipt of the next LPM transaction. LPMEN must be set to '0b11. Both LPMXMT and LPMEN must be set in the same cycle.

0 = Maintain current state

When LPMXMT and LPMEN are set, the USB module can respond in the following ways:

- If no data is pending (all TX FIFOs are empty), the USB module will respond with an ACK. The bit will self clear and a software interrupt will be generated.
- If data is pending (data resides in at least one TX FIFO), the USB module will respond with a NYET. In this case, the bit will not self clear however a software interrupt will be generated.

When in *Host mode*:

1 = USB module will transmit an LPM transaction. This bit is self clearing, and will be immediately cleared upon receipt of any Token or three time-outs have occurred.

0 = Maintain current state

bit 15-12 **ENDPOINT<3:0>:** LPM Token Packet Endpoint bits

This is the endpoint in the token packet of the LPM transaction.

bit 11-9 **Unimplemented:** Read as '0'

bit 8 **RMTWAK:** Remote Wake-up Enable bit

This bit is applied on a temporary basis only and is only applied to the current suspend state.

1 = Remote wake-up is enabled

0 = Remote wake-up is disabled

bit 7-4 **HIRD<3:0>:** Host Initiated Resume Duration bits

The minimum time the host will drive resume on the bus. The value in this register corresponds to an actual resume time of:

Resume Time = 50 µs + HIRD * 75 µs. The resulting range is 50 µs to 1200 µs.

bit 3-0 **LNKSTATE<3:0>:** Link State bits

This value is provided by the host to the peripheral to indicate what state the peripheral must transition to after the receipt and acceptance of a LPM transaction. The only valid value for this register is '1' for Sleep State (L1). All other values are reserved.

Legend:	HS = Hardware Set		
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31-12 **Unimplemented:** Read as '0'

bit 11 **DMAEIF:** DMA Bus Error Interrupt Flag bit
1 = DMA bus error has occurred
0 = DMA bus error has not occurred

bit 10 **PKTCOMPIF:** DMA Buffer Descriptor Processor Packet Completion Interrupt Flag bit
1 = DMA BD packet is complete
0 = DMA BD packet is in progress

bit 9 **BDDONEIF:** DMA Buffer Descriptor Done Interrupt Flag bit
1 = DMA BD process is done
0 = DMA BD process is in progress

bit 8 **CONTHRIF:** Control Buffer Threshold Interrupt Flag bit
1 = The control buffer has more than THRES words of space available
0 = The control buffer has less than THRES words of space available

bit 7 **CONEMPTYIF:** Control Buffer Empty Interrupt Flag bit
1 = Control buffer is empty
0 = Control buffer is not empty

bit 6 **CONFULLIF:** Control Buffer Full Interrupt Flag bit
1 = Control buffer is full
0 = Control buffer is not full

bit 5 **RXTHRIF:** Receive Buffer Threshold Interrupt Flag bit(1)
1 = Receive buffer has more than RXINTTHR words of space available
0 = Receive buffer has less than RXINTTHR words of space available

bit 4 **RXFULLIF:** Receive Buffer Full Interrupt Flag bit
1 = Receive buffer is full
0 = Receive buffer is not full

bit 3 **RXEMPTYIF:** Receive Buffer Empty Interrupt Flag bit
1 = Receive buffer is empty
0 = Receive buffer is not empty

Note 1: In Boot/XIP mode, the POR value of the receive buffer threshold is zero. Therefore, this bit will be set to a '1', immediately after a POR until a read request on the System Bus is received.

Note: The bits in the register are cleared by writing a '1' to the corresponding bit position.

bit 17 **DUALBUF:** Dual Read/Write Buffers enable bit
This bit is valid in Master mode only.
1 = PMP uses separate registers for reads and writes (PMRADDR, PMDATAIN, PMWADDR, PMDATAOUT)
0 = PMP uses legacy registers (PMADDR, PMDATA)

bit 16 **Unimplemented:** Read as '0'

bit 15 **ON:** Parallel Master Port Enable bit
1 = PMP is enabled
0 = PMP is disabled, no off-chip access performed

bit 14 **Unimplemented:** Read as '0'

bit 13 **SIDL:** Stop in Idle Mode bit
1 = Discontinue module operation when device enters Idle mode
0 = Continue module operation in Idle mode

bit 12-11 **ADRMUX<1:0>:** Address/Data Multiplexing Selection bits
11 = Lower 8 bits of address are multiplexed on PMD<15:0> pins; upper 8 bits are not used
10 = All 16 bits of address are multiplexed on PMD<15:0> pins
01 = Lower 8 bits of address are multiplexed on PMD<7:0> pins, upper bits are on PMA<15:8>
00 = Address and data appear on separate pins

bit 10 **PMPTTL:** PMP Module TTL Input Buffer Select bit
1 = PMP module uses TTL input buffers
0 = PMP module uses Schmitt Trigger input buffer

bit 9 **PTWREN:** Write Enable Strobe Port Enable bit
1 = PMWR/PMENB port is enabled
0 = PMWR/PMENB port is disabled

bit 8 **PTRDEN:** Read/Write Strobe Port Enable bit
1 = PMRD/PMWR port is enabled
0 = PMRD/PMWR port is disabled

Note 1: These bits have no effect when their corresponding pins are used as address lines.

A.2 Analog-to-Digital Converter (ADC)

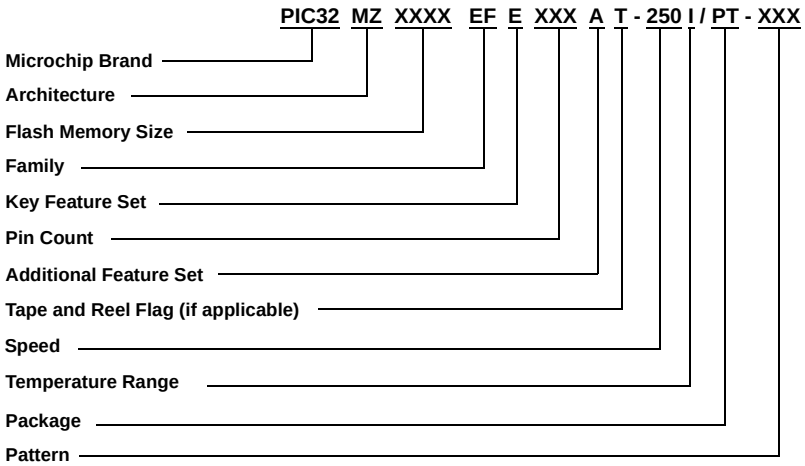
The PIC32MZ EF family of devices has a new 12-bit High-Speed Successive Approximation Register (SAR) ADC module that replaces the 10-bit ADC module in PIC32MX5XX/6XX/7XX devices; therefore, the use of **Bold** type to show differences is *not* used in the following table. Note that not all register differences are described in this section; however, the key feature differences are listed in Table A-3.

TABLE A-3: ADC DIFFERENCES

PIC32MX5XX/6XX/7XX Feature	PIC32MZ EF Feature
Clock Selection and Operating Frequency (TAD)	
On PIC32MX devices, the ADC clock was derived from either the FRC or from the PBCLK. ADRC (AD1CON3<15>) 1 = FRC clock 0 = Clock derived from Peripheral Bus Clock (PBCLK)	On PIC32MZ EF devices, the three possible sources of the ADC clock are FRC, REFCLKO3, and SYSCLK. ADCSEL<1:0> (ADCCON3<31:30>) 11 = FRC 10 = REFCLKO3 01 = SYSCLK 00 = Reserved
On PIC32MX devices, if the ADC clock was derived from the PBCLK, that frequency was divided further down, with a maximum divisor of 512, and a minimum divisor of two. ADCS<7:0> (AD1CON3<7:0>) 11111111 = 512 * TPB = TAD • • • 00000001 = 4 * TPB = TAD 00000000 = 2 * TPB = TAD	On PIC32MZ EF devices, any ADC clock source can be divided down separately for each dedicated ADC and the shared ADC, with a maximum divisor of 254. The input clock can also be fed directly to the ADC. ADCDIV<6:0> (ADCTIMEx<22:16>) ADCDIV<6:0> (ADCCON2<6:0>) 1111111 = 254 * TQ = TAD • • • 0000011 = 6 * TQ = TAD 0000010 = 4 * TQ = TAD 0000001 = 2 * TQ = TAD 0000000 = TQ = TAD

PRODUCT IDENTIFICATION SYSTEM

To order or obtain information, e.g., on pricing or delivery, refer to the factory or the listed sales office.



Example:

PIC32MZ2048EFH144-I/PT:
Embedded Connectivity PIC32,
MIPS32® M-Class MPU core,
2048 KB program memory,
144-pin, with Floating Point Unit,
Industrial temperature, TQFP package.

Flash Memory Family

Architecture	MZ	= MIPS32® M-Class MPU Core
Flash Memory Size	0512	= 512 KB
	1024	= 1024 KB
	2048	= 2048 KB
Family	EF	= Embedded Connectivity Microcontroller Family with Floating Point Unit
Key Feature	E	= PIC32 EF Family Features (no CAN, no Crypto)
	F	= PIC32 EF Family Features (CAN, no Crypto)
	G	= PIC32 EF Family Features (no CAN, no Crypto)
	H	= PIC32 EF Family Features (CAN, no Crypto)
	K	= PIC32 EF Family Features (Crypto and CAN)
	M	= PIC32 EF Family Features (Crypto and CAN)
Pin Count	064	= 64-pin
	100	= 100-pin
	124	= 124-pin
	144	= 144-pin
Speed	Blank	= Up to 200 MHz
	250	= Up to 252 MHz
Temperature Range	I	= -40°C to +85°C (Industrial)
	E	= -40°C to +125°C (Extended)
Package	MR	= 64-Lead (9x9x0.9 mm) QFN (Plastic Quad Flatpack)
	PT	= 64-Lead (10x10x1 mm) TQFP (Thin Quad Flatpack)
	PT	= 100-Lead (12x12x1 mm) TQFP (Thin Quad Flatpack)
	PF	= 100-Lead (14x14x1 mm) TQFP (Thin Quad Flatpack)
	TL	= 124-Lead (9x9x0.9 mm) VTLA (Very Thin Leadless Array)
	PH	= 144-Lead (16x16x1 mm) TQFP (Thin Quad Flatpack)
	PL	= 144-Lead (20x20x1.40 mm) LQFP (Low Profile Quad Flatpack)
Pattern		Three-digit QTP, SQTP, Code or Special Requirements (blank otherwise)
	ES	= Engineering Sample
