What is "[Embedded - Microcontrollers](#)"?

"[Embedded - Microcontrollers](#)" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

1.0 DEVICE OVERVIEW

Note: This data sheet summarizes the features of the PIC32MZ EF family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to the “*PIC32 Family Reference Manual*”, which is available from the Microchip web site (www.microchip.com/PIC32).

This data sheet contains device-specific information for PIC32MZ EF devices.

Figure 1-1 illustrates a general block diagram of the core and peripheral modules in the PIC32MZ EF family of devices.

Table 1-21 through Table 1-22 list the pinout I/O descriptions for the pins shown in the device pin tables (see Table 2 through Table 5).

Figure 26-10 shows the Security Association control word structure.

The Crypto Engine fetches different structures for different flows and ensures that hardware fetches minimum words from SA required for processing. The structure is ready for hardware optimal data fetches.

Note 1: These parameters are characterized, but not tested in manufacturing.

2: This jitter specification is based on clock-cycle by clock-cycle measurements. To get the effective jitter for individual time-bases on communication clocks, use the following formula:

$$\text{EffectiveJitter} = \frac{D_{CLK}}{\sqrt{\frac{PBCLK2}{CommunicationClock}}}$$

For example, if PBCLK2 = 100 MHz and SPI bit rate = 50 MHz, the effective jitter is as follows:

$$\text{EffectiveJitter} = \frac{D_{CLK}}{\sqrt{\frac{100}{50}}} = \frac{D_{CLK}}{1.41}$$

39.0 252 MHz ELECTRICAL CHARACTERISTICS

This section provides an overview of the PIC32MZ EF electrical characteristics for devices running at 252 MHz. Additional information will be provided in future revisions of this document as it becomes available.

The specifications for 252 MHz are identical to those shown in **37.0 “Electrical Characteristics”** including absolute maximum ratings, with the exception of the parameters listed in this chapter.

Parameters in this chapter begin with the letter “M”, which denotes 252 MHz operation. For example, parameter DC27a in **37.0 “Electrical Characteristics”**, is the up to 200 MHz operation equivalent for MDC27a.

A.7 Interrupts and Exceptions

The key difference between Interrupt Controllers in PIC32MX5XX/6XX/7XX devices and PIC32MZ EF devices concerns vector spacing. Previous PIC32MX devices had fixed vector spacing, which is adjustable in set increments, and every interrupt had the same amount of space. PIC32MZ EF devices replace this with a variable offset spacing, where each interrupt has an offset register to determine where to begin execution.

In addition, the IFSx, IECx, and IPCx registers for old peripherals have shifted to different registers due to new peripherals. Please refer to **7.0 “CPU Exceptions and Interrupt Controller”** to determine where the interrupts are now located.

Table A-8 lists differences (indicated by **Bold** type) in the registers that will affect software migration.

TABLE A-8: INTERRUPT DIFFERENCES

PIC32MX5XX/6XX/7XX Feature	PIC32MZ EF Feature
Vector Spacing	
On PIC32MX devices, the vector spacing was determined by the VS field in the CPU core.	On PIC32MZ EF devices, the vector spacing is variable and determined by the Interrupt controller. The VOFFx<17:1> bits in the OFFx register are set to the offset from EBASE where the interrupt service routine is located.
Shadow Register Sets	
VS<4:0> (IntCtl<9:5> : CP0 Register 12, Select 1) 10000 = 512-byte vector spacing 01000 = 256-byte vector spacing 00100 = 128-byte vector spacing 00010 = 64-byte vector spacing 00001 = 32-byte vector spacing 00000 = 0-byte vector spacing	VOFFx<17:1> (OFFx<17:1> Interrupt Vector ‘x’ Address Offset bits)

SS0 (INTCON<16>) 1 = Single vector is presented with a shadow register set 0 = Single vector is not presented with a shadow register set	SS0 (PRISS<0>) 1 = Single vector is presented with a shadow register set 0 = Single vector is not presented with a shadow register set
Status	
PIC32MX devices, the VEC<5:0> bits show which interrupt is being serviced.	On PIC32MZ EF devices, the SIRQ<7:0> bits show the IRQ number of the interrupt last serviced.
VEC<5:0> (INTSTAT<5:0>) 11111-00000 = The interrupt vector that is presented to the CPU	SIRQ<7:0> (INTSTAT<7:0>) 11111111-00000000 = The last interrupt request number serviced by the CPU
