Welcome to E-XFL.COM

What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Note 1: PBCLK1 is used by system modules and cannot be turned off.

2: SYSCLK/PBCLK1 is used to fetch data from/to the Flash Controller, while the FRC clock is used for programming.

3: Special Function Register (SFR) access only.

4: Timer1 only.

5: PBCLK1 divided by 2 is available on the OSC2 pin in certain clock modes.

8.1 Fail-Safe Clock Monitor (FSCM)

The PIC32MZ EF oscillator system includes a Fail-safe Clock Monitor (FSCM). The FSCM monitors the SYSCLK for continuous operation. If it detects that the SYSCLK has failed, it switches the SYSCLK over to the BFRC oscillator and triggers a NMI. The BFRC is an untuned 8 MHz oscillator that will drive the SYSCLK during FSCM event. When the NMI is executed, software can attempt to restart the main oscillator or shut down the system.

In Sleep mode both the SYSCLK and the FSCM halt, which prevents FSCM detection.

bit 31-24 **CHPIGN<7:0>:** Channel Register Data bits
Pattern Terminate mode:
Any byte matching these bits during a pattern match may be ignored during the pattern match determination when the CHPIGNEN bit is set. If a byte is read that is identical to this data byte, the pattern match logic will treat it as a "don't care" when the pattern matching logic is enabled and the CHPIGEN bit is set.

bit 23-16 **Unimplemented:** Read as '0'

bit 15 **CHBUSY:** Channel Busy bit
1 = Channel is active or has been enabled
0 = Channel is inactive or has been disabled

bit 14 **Unimplemented:** Read as '0'

1 = Treat any byte that matches the CHPIGN<7:0> bits as a "don't care" when pattern matching is enabled
0 = Disable this feature

1 = 2 byte length
0 = 1 byte length

bit 10-9 **Unimplemented:** Read as '0'

bit 8 **CHCHNS:** Chain Channel Selection bit(1)
1 = Chain to channel lower in natural priority (CH1 will be enabled by CH2 transfer complete)
0 = Chain to channel higher in natural priority (CH1 will be enabled by CH0 transfer complete)

bit 7 **CHEN:** Channel Enable bit(2)
1 = Channel is enabled
0 = Channel is disabled

bit 6 **CHAED:** Channel Allow Events If Disabled bit
1 = Channel start/abort events will be registered, even if the channel is disabled
0 = Channel start/abort events will be ignored if the channel is disabled

bit 5 **CHCHN:** Channel Chain Enable bit
1 = Allow channel to be chained
0 = Do not allow channel to be chained

Note 1: The chain selection bit takes effect when chaining is enabled (i.e., CHCHN = 1).

2: When the channel is suspended by clearing this bit, the user application should poll the CHBUSY bit (if available on the device variant) to see when the channel is suspended, as it may take some clock cycles to complete a current transaction before the channel is suspended.

Note 1: This bit or register is not available on 64-pin devices.
2: This bit or register is not available on 64-pin and 100-pin devices.
3: Before enabling the ADC, the user application must initialize the ADC calibration values by copying them from the factory-programmed DEVADCx Flash registers into the corresponding ADCxCFG registers.

bit 31-15 **Unimplemented:** Read as '0'

bit 14 **TXBUSE:** Transmit BVCI Bus Error Interrupt bit(2)

1 = BVCI Bus Error has occurred
0 = BVCI Bus Error has not occurred

This bit is set when the TX DMA encounters a BVCI Bus error during a memory access. It is cleared by either a Reset or CPU write of a '1' to the CLR register.

bit 13 **RXBUSE:** Receive BVCI Bus Error Interrupt bit(2)

1 = BVCI Bus Error has occurred
0 = BVCI Bus Error has not occurred

This bit is set when the RX DMA encounters a BVCI Bus error during a memory access. It is cleared by either a Reset or CPU write of a '1' to the CLR register.

bit 12-10 **Unimplemented:** Read as '0'

bit 9 **EWMARK:** Empty Watermark Interrupt bit(2)

1 = Empty Watermark pointer reached
0 = No interrupt pending

This bit is set when the RX Descriptor Buffer Count is less than or equal to the value in the RXEWM bit (ETHRXWM<0:7>) value. It is cleared by BUFCNT bit (ETHSTAT<16:23>) being incremented by hardware. Writing a '0' or a '1' has no effect.

bit 8 **FWMARK:** Full Watermark Interrupt bit(2)

1 = Full Watermark pointer reached
0 = No interrupt pending

This bit is set when the RX Descriptor Buffer Count is greater than or equal to the value in the RXFWM bit (ETHRXWM<16:23>) field. It is cleared by writing the BUFCDEC (ETHCON1<0>) bit to decrement the BUFCNT counter. Writing a '0' or a '1' has no effect.

Note 1: This bit is only used for TX operations.
2: This bit is are only used for RX operations.

Note: It is recommended to use the SET, CLR, or INV registers to set or clear any bit in this register. Setting or clearing any bits in this register should only be done for debug/test purposes.

B.12 Crypto Engine

Table B-7 lists the changes available for the Crypto Engine.

TABLE B-7: CRYPTO DIFFERENCES

PIC32MZ EC Feature	PIC32MZ EF Feature
Output Data Format	
On PIC32MZ EC devices, the output of the Crypto Engine is always in big-endian format, usually requiring a software (or DMA) solution to put the data into little-endian format, which the core handles natively.	On PIC32MZ EF devices, the SWAPOEN bit (CECON<7>) has been added to control output byte swapping. This bit, when enabled, will byte-swap the output.

B.13 Device Configuration and Control

A number of enhancements have been added to the PIC32MZ EF devices that allow greater control and flexibility on the device. Some bit fields have also changed location. Table B-8 lists these changes.

TABLE B-8: DEVICE CONFIGURATION AND CONTROL DIFFERENCES

PIC32MZ EC Feature	PIC32MZ EF Feature
MCLR Pin Configuration	
On PIC32MZ EC devices, the MCLR pin always generate a system reset.	On PIC32MZ EF devices, the $\overline{\text{MCLR}}$ pin can now be configured to generate either a system Reset or an emulated POR Reset. SMCLR (DEVCFG0<15>) 1 = MCLR pin generates a normal system Reset 0 = MCLR pin generates an emulated POR Reset
I/O Analog Charge Pump	
Low V_{DD} environments cause attenuation of analog inputs.	A new bit enables an I/O charge pump, which improves analog performance when operating at lower V_{DD}. IOANCPEN (CFGCON<7>) 1 = Charge pump is enabled 0 = Charge pump is disabled
EBI Ready Pin Control	
EBIRDYINV<3:1> (CFGEBIC<30:28>) EBIRDYEN<3:1> (CFGEBIC<26:24>)	The EBIRDY control bits have been moved. EBIRDYINV<3:1> (CFGEBIC<31:29>) EBIRDYEN<3:1> (CFGEBIC<27:25>)
Boot Flash Sequence Control	
On PIC32MZ EC devices, the Boot Flash Sequence (specifying which boot memory was mapped to the lower boot alias) was determined with the BFxSEQ0 registers.	On PIC32MZ EF devices, the Boot Flash Sequence has been moved to the BFxSEQ3 register.
