What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

4.2 System Bus Arbitration

Note: The System Bus interconnect implements one or more instantiations of the SonicsSX® interconnect from Sonics, Inc. This document contains materials that are (c) 2003-2015 Sonics, Inc., and that constitute proprietary information of Sonics, Inc. SonicsSX is a registered trademark of Sonics, Inc. All such materials and trademarks are used under license from Sonics, Inc.

As shown in the PIC32MZ EF Family Block Diagram (see Figure 1-1), there are multiple initiator modules (I1 through I14) in the system that can access various target modules (T1 through T13). Table 4-4 illustrates which initiator can access which target. The System Bus supports simultaneous access to targets by initiators, so long as the initiators are accessing different targets. The System Bus will perform arbitration, if multiple initiators attempt to access the same target.

2: Once this bit is set, any read of the RSWRST register will cause a reset to occur.

Note 1: The test conditions for I_{PD} current measurements are as follows:

- Oscillator mode is EC (for 8 MHz and below) and EC+PLL (for above 8 MHz) with OSC1 driven by external square wave from rail-to-rail, (OSC1 input clock input over/undershoot < 100 mV required)
- OSC2/CLKO is configured as an I/O input pin
- USB PLL is disabled (USBMD = 1), V_{USB3V3} is connected to V_{SS}
- CPU is in Sleep mode
- L1 Cache and Prefetch modules are disabled
- No peripheral modules are operating, (ON bit = 0), and the associated PMD bit is set. All clocks are disabled ON bit (PBxDIV<15>) = 0 (x ≠ 1,7)
- WDT, DMT, Clock Switching, Fail-Safe Clock Monitor, and Secondary Oscillator are disabled
- All I/O pins are configured as inputs and pulled to V_{SS}
- $\overline{MCLR}$ = V_{DD}
- RTCC and JTAG are disabled
- Voltage regulator is in Stand-by mode (VREGS = 0)

2: Data in the "Typical" column is at 3.3V, +25°C unless otherwise stated. Parameters are for design guidance only and are not tested.

3: The Δ current is the additional current consumed when the module is enabled. This current should be added to the base I_{PD} current.

4: Voltage regulator is operational (VREGS = 1).

5: Data in the "Maximum" column is at 3.3V, +125ºC at specified operating frequency, unless otherwise stated. Parameters are for design guidance only and are not tested.

40.0 AC AND DC CHARACTERISTICS GRAPHS

Note: The graphs provided are a statistical summary based on a limited number of samples and are provided for design guidance purposes only. The performance characteristics listed herein are not tested or guaranteed. In some graphs, the data presented may be outside the specified operating range (e.g., outside specified power supply range) and therefore, outside the warranted range.

A.9 Other Peripherals and Features

Most of the remaining peripherals on PIC32MZ EF devices act identical to their counterparts on PIC32MX-5XX/6XX/7XX devices. The main differences have to do with handling the increased peripheral bus clock speed and additional clock sources.

Table A-10 lists the differences (indicated by **Bold** type) that will affect software and hardware migration.

TABLE A-10: PERIPHERAL DIFFERENCES

PIC32MX5XX/6XX/7XX Feature	PIC32MZ EF Feature
I^2C	
On PIC32MX devices, all pins are 5V-tolerant.	On PIC32MZ EF devices, the I2C4 port uses non-5V tolerant pins, and will have different VOL/VOH specifications.
I2CxBRG<**11**:0>	The Baud Rate Generator register has been expanded from 12 bits to 16 bits. I2CxBRG<**15**:0>
Watchdog Timer	
Clearing the Watchdog Timer on PIC32MX5XX/6XX/7XX devices required writing a '1' to the WDTCLR bit. **WDTCLR** (WDTCON<**0**>)	On PIC32MZ EF devices, the WDTCLR bit has been replaced with the 16-bit WDTCLRKEY, which must be written with a specific value (0x5743) to clear the Watchdog Timer. In addition, the WDTSPGM (DEVCFG1<21>) bit is used to control operation of the Watchdog Timer during Flash programming. **WDTCLRKEY<15:0>** (WDTCON<**31:16**>)
RTCC	
On PIC32MX devices, the output of the RTCC pin was selected between the Seconds Clock or the Alarm Pulse. RTCSECSEL (RTCCON<7>) 1 = RTCC Seconds Clock is selected for the RTCC pin 0 = RTCC Alarm Pulse is selected for the RTCC pin	On PIC32MZ EF devices, the RTCC Clock is added as an option. RTCSECSEL has been renamed RTCOUTSEL and expanded to two bits. **RTCOUTSEL<1:0>** (RTCCON<**8:**7>) **11 = Reserved** **10 = RTCC Clock is presented on the RTCC pin** 01 = Seconds Clock is presented on the RTCC pin 00 = Alarm Pulse is presented on the RTCC pin when the alarm interrupt is triggered
On PIC32MX devices, the Secondary Oscillator (SOSC) serves as the input clock for the RTCC module.	On PIC32MZ EF devices, an additional clock source, LPRC, is available as a choice for the input clock. **RTCCLKSEL<1:0> (RTCCON<10:9>)** **11 = Reserved** **10 = Reserved** **01 = RTCC uses the external 32.768 kHz SOSC** **00 = RTCC uses the internal 32 kHz oscillator (LPRC)**
