What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Legend: R = Read; R/W = Read/Write; 'x' in a register name = 0-13; 'y' in a register name = 0-8.

Note 1: Reset values for these bits are '0', '1', '1', '1', respectively.

2: The BASE<21:0> bits must be set to the corresponding Physical Address and right shifted by 10 bits. For Read-only bits, this value is set by hardware on Reset.

3: The SIZE<4:0> bits must be set to the corresponding Region Size, based on the following formula: Region Size = $2^{(SIZE-1)}$ x 1024 bytes. For read-only bits, this value is set by hardware on Reset.

4: Refer to the Device Memory Maps (Figure 4-1 through Figure 4-4) for specific device memory sizes and start addresses.

5: See Table 4-1for information on specific target memory size and start addresses.

6: The SBTxREG1 SFRs are reserved, and therefore, are not listed in this table for this target.

Legend:			
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31-16 **Unimplemented:** Read as '0'

bit 15 **ALRMEN:** Alarm Enable bit(1,2)
- 1 = Alarm is enabled
- 0 = Alarm is disabled

bit 14 **CHIME:** Chime Enable bit(2)
- 1 = Chime is enabled – ARPT<7:0> is allowed to rollover from 0x00 to 0xFF
- 0 = Chime is disabled – ARPT<7:0> stops once it reaches 0x00

bit 13 **PIV:** Alarm Pulse Initial Value bit(2)

When ALRMEN = 0, PIV is writable and determines the initial value of the Alarm Pulse.
When ALRMEN = 1, PIV is read-only and returns the state of the Alarm Pulse.

bit 12 **ALRMSYNC:** Alarm Sync bit
- 1 = ARPT<7:0> and ALRMEN may change as a result of a half second rollover during a read. The ARPT must be read repeatedly until the same value is read twice. This must be done since multiple bits may be changing.
- 0 = ARPT<7:0> and ALRMEN can be read without concerns of rollover because the prescaler is more than 32 real-time clocks away from a half-second rollover

bit 11-8 **AMASK<3:0>:** Alarm Mask Configuration bits(2)
- 0000 = Every half-second
- 0001 = Every second
- 0010 = Every 10 seconds
- 0011 = Every minute
- 0100 = Every 10 minutes
- 0101 = Every hour
- 0110 = Once a day
- 0111 = Once a week
- 1000 = Once a month
- 1001 = Once a year (except when configured for February 29, once every four years)
- 1010 = Reserved
- 1011 = Reserved
- 11xx = Reserved

Note 1: Hardware clears the ALRMEN bit anytime the alarm event occurs, when ARPT<7:0> = 00 and CHIME = 0.

2: This field should not be written when the RTCC ON bit = '1' (RTCCON<15>) and ALRMSYNC = 1.

Note: This register is reset only on a Power-on Reset (POR).

Note 1: To change this bit, the unlock sequence must be performed. Refer to **Section 42. "Oscillators with Enhanced PLL"** (DS60001250) in the *"PIC32 Family Reference Manual"* for details.

35.0 INSTRUCTION SET

The PIC32MZ EF family instruction set complies with the MIPS32® Release 5 instruction set architecture. The PIC32MZ EF device family *does not* support the following features:

- Core extend instructions
- Coprocessor 2 instructions

Note: Refer to *"MIPS32® Architecture for Programmers Volume II: The MIPS32® Instruction Set"* at www.imgtec.com for more information.

36.11 Demonstration/Development Boards, Evaluation Kits, and Starter Kits

A wide variety of demonstration, development and evaluation boards for various PIC MCUs and dsPIC DSCs allows quick application development on fully functional systems. Most boards include prototyping areas for adding custom circuitry and provide application firmware and source code for examination and modification.

The boards support a variety of features, including LEDs, temperature sensors, switches, speakers, RS-232 interfaces, LCD displays, potentiometers and additional EEPROM memory.

The demonstration and development boards can be used in teaching environments, for prototyping custom circuits and for learning about various microcontroller applications.

In addition to the PICDEM™ and dsPICDEM™ demonstration/development board series of circuits, Microchip has a line of evaluation kits and demonstration software for analog filter design, KEELOQ® security ICs, CAN, IrDA®, PowerSmart battery management, SEEVAL® evaluation system, Sigma-Delta ADC, flow rate sensing, plus many more.

Also available are starter kits that contain everything needed to experience the specified device. This usually includes a single application and debug capability, all on one board.

Check the Microchip web page (www.microchip.com) for the complete list of demonstration, development and evaluation kits.

36.12 Third-Party Development Tools

Microchip also offers a great collection of tools from third-party vendors. These tools are carefully selected to offer good value and unique functionality.

- Device Programmers and Gang Programmers from companies, such as SoftLog and CCS
- Software Tools from companies, such as Gimpel and Trace Systems
- Protocol Analyzers from companies, such as Saleae and Total Phase
- Demonstration Boards from companies, such as MikroElektronika, Digilent® and Olimex
- Embedded Ethernet Solutions from companies, such as EZ Web Lynx, WIZnet and IPLogika®

Revision C (March 2016)

In this revision, the Preliminary status was removed from the document footer.

The revision also includes the following major changes, which are referenced by their respective chapter in Table C-2. In addition, minor updates to text and formatting were incorporated throughout the document.

TABLE C-2: MAJOR SECTION UPDATES

Section Name	Update Description
2.0 "Guidelines for Getting Started with 32-bit Microcontrollers"	**2.9.1.3 "EMI/EMC/EFT (IEC 61000-4-4 and IEC 61000-4-2) Suppression Considerations"** and Figure 2-5 were updated.
4.0 "Memory Organization"	The names of the Boot Flash Words were updated from BFxSEQ0 to BFxSEQ3 (see **4.1.1 "Boot Flash Sequence and Configuration Spaces"**). The ABFxSEQx registers were removed from the Boot Flash Sequence and Configuration tables (see Table 4-2 and Table 4-3).
7.0 "CPU Exceptions and Interrupt Controller"	The Cache Error exception type was removed from the MIPS32 M-Class Microprocessor Core Exception Types (see Table 7-1).
8.0 "Oscillator Configuration"	The PLLODIV<2:0> bit value settings were updated in the SPLLCON register (see Register 8-3).
12.0 "I/O Ports"	The SIDL bit was removed from the CNCONx registers (see Table 12-4 through Table 12-21 and Register 12-3).
20.0 "Serial Quad Interface (SQI)"	The following bits were removed from the SQI1XCON1 register (see Table 20-1 and Register 20-1): DDRDATA, DDRDUMMY, DDRMODE, DDRADDR, and DDRCMD. The DDRMODE bit was removed from the SQI1CON register (see Table 20-1 and Register 20-4).
28.0 "12-bit High-Speed Successive Approximation Register (SAR) Analog-to-Digital Converter (ADC)"	A note was added to the SELRES<1:0> bits in the ADCCON1 and ADCxTIME registers (see Register 28-1 and Register 28-27). The ADCID<2:0 bit values were updated in the ADCFSTAT register (see Register 28-22).
34.0 "Special Features"	The bit value definitions for the POSCGAIN<1:0> and SOSCGAIN<1:0> bits were updated (see Register 34-3). The Device ADC Calibration Word (DEVADCx) register was added (see Table 34-5 and Register 34-13).
