
Welcome to E-XFL.COM

Understanding Embedded - Microprocessors

Embedded microprocessors are specialized computing chips designed to perform specific tasks within an embedded system. Unlike general-purpose microprocessors found in personal computers, embedded microprocessors are tailored for dedicated functions within larger systems, offering optimized performance, efficiency, and reliability. These microprocessors are integral to the operation of countless electronic devices, providing the computational power necessary for controlling processes, handling data, and managing communications.

Applications of Embedded - Microprocessors

Embedded microprocessors are utilized across a broad spectrum of applications, making them indispensable in

Details	
Product Status	Obsolete
Core Processor	PowerPC e600
Number of Cores/Bus Width	2 Core, 32-Bit
Speed	1.0GHz
Co-Processors/DSP	-
RAM Controllers	DDR, DDR2
Graphics Acceleration	No
Display & Interface Controllers	-
Ethernet	10/100/1000Mbps (4)
SATA	-
USB	-
Voltage - I/O	1.8V, 2.5V, 3.3V
Operating Temperature	-40°C ~ 105°C (TA)
Security Features	-
Package / Case	1023-BBGA, FCBGA
Supplier Device Package	1023-FCCBGA (33x33)
Purchase URL	https://www.e-xfl.com/product-detail/nxp-semiconductors/mc8641dthx1000nc

1.1 Key Features

The following lists an overview of the MPC8641 key feature set:

- Major features of the e600 core are as follows:
  - High-performance, 32-bit superscalar microprocessor that implements the PowerPC ISA
  - Eleven independent execution units and three register files
    - Branch processing unit (BPU)
    - Four integer units (IUs) that share 32 GPRs for integer operands
    - 64-bit floating-point unit (FPU)
    - Four vector units and a 32-entry vector register file (VRs)
    - Three-stage load/store unit (LSU)
  - Three issue queues, FIQ, VIQ, and GIQ, can accept as many as one, two, and three instructions, respectively, in a cycle.
  - Rename buffers
  - Dispatch unit
  - Completion unit
  - Two separate 32-Kbyte instruction and data level 1 (L1) caches
  - Integrated 1-Mbyte, eight-way set-associative unified instruction and data level 2 (L2) cache with ECC
  - 36-bit real addressing
  - Separate memory management units (MMUs) for instructions and data
  - Multiprocessing support features
  - Power and thermal management
  - Performance monitor
  - In-system testability and debugging features
  - Reliability and serviceability
- MPX coherency module (MCM)
  - Ten local address windows plus two default windows
  - Optional low memory offset mode for core 1 to allow for address disambiguation
- Address translation and mapping units (ATMUs)
  - Eight local access windows define mapping within local 36-bit address space
  - Inbound and outbound ATMUs map to larger external address spaces
  - Three inbound windows plus a configuration window on PCI Express
  - Four inbound windows plus a default window on serial RapidIO
  - Four outbound windows plus default translation for PCI Express
  - Eight outbound windows plus default translation for serial RapidIO with segmentation and sub-segmentation support

Table 1. Absolute Maximum Ratings[1] (continued)

Characteristic		Symbol	Absolute Maximum Value	Unit	Notes
Input voltage	DDR and DDR2 SDRAM signals	D*n*_MV_{IN}	– 0.3 to (D*n*_GV_{DD} + 0.3)	V	5
	DDR and DDR2 SDRAM reference	D*n*_MV_{REF}	– 0.3 to (D*n*_GV_{DD}/2 + 0.3)	V	—
	Three-speed Ethernet signals	LV_{IN} TV_{IN}	GND to (LV_{DD}+ 0.3) GND to (TV_{DD}+ 0.3)	V	5
	DUART, Local Bus, DMA, Multiprocessor Interrupts, System Control & Clocking, Debug, Test, Power management, I^2C, JTAG and Miscellaneous I/O voltage	OV_{IN}	GND to (OV_{DD}+ 0.3)	V	5
Storage temperature range		T_{STG}	–55 to 150	°C	—

Notes:

1. Functional and tested operating conditions are given in Table 2. Absolute maximum ratings are stress ratings only, and functional operation at the maxima is not guaranteed. Stresses beyond those listed may affect device reliability or cause permanent damage to the device.
2. Core 1 characteristics apply only to MPC8641D. If two separate power supplies are used for V_{DD}_Core0 and V_{DD}_Core1, they must be kept within 100 mV of each other during normal run time.
3. The –0.3 to 2.75 V range is for DDR and –0.3 to 1.98 V range is for DDR2.
4. The 3.63V maximum is only supported when the port is configured in GMII, MII, RMII, or TBI modes; otherwise the 2.75V maximum applies. See Section 8.2, "FIFO, GMII, MII, TBI, RGMII, RMII, and RTBI AC Timing Specifications," for details on the recommended operating conditions per protocol.
5. During run time (M,L,T,O)V_{IN} and D*n*_MV_{REF} may overshoot/undershoot to a voltage and for a maximum duration as shown in Figure 2.

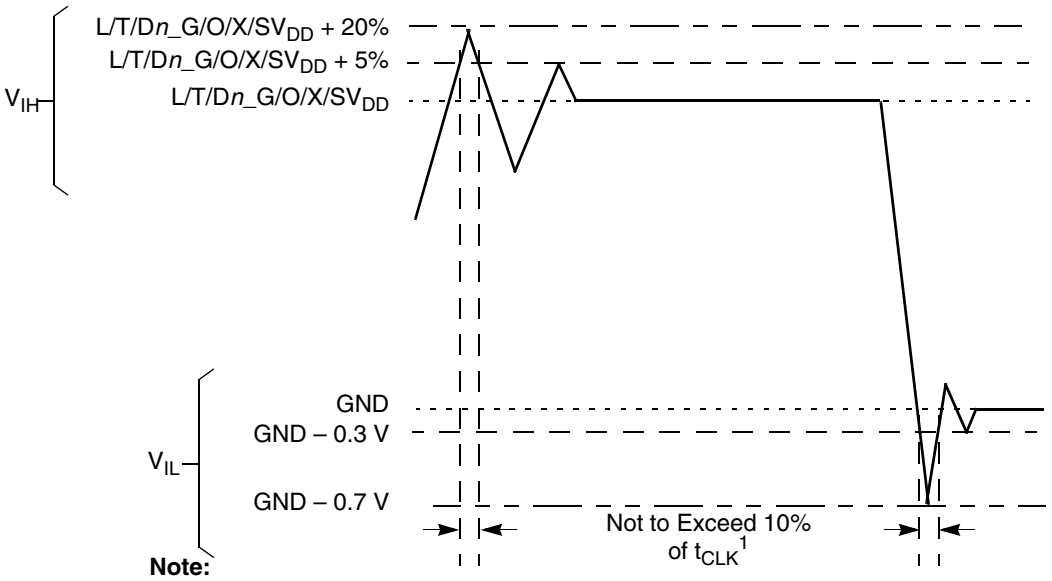
2.1.2 Recommended Operating Conditions

Table 2 provides the recommended operating conditions for the MPC8641. Note that the values in Table 2 are the recommended and tested operating conditions. Proper device operation outside of these conditions is not guaranteed. For details on order information and specific operating conditions for parts, see Section 21, "Ordering Information."

Table 2. Recommended Operating Conditions

Characteristic	Symbol	Recommended Value	Unit	Notes
Cores supply voltages	V_{DD}_Core0, V_{DD}_Core1	1.10 ± 50 mV	V	1, 2, 8
		1.05 ± 50 mV		1, 2, 7
		0.95 ± 50 mV		1, 2, 12
Cores PLL supply	AV_{DD}_Core0, AV_{DD}_Core1	1.10 ± 50 mV	V	8, 13
		1.05 ± 50 mV		7, 13
		0.95 ± 50 mV		12, 13
SerDes Transceiver Supply (Ports 1 and 2)	SV_{DD}	1.10 ± 50 mV	V	8, 11
		1.05 ± 50 mV		7, 11

Figure 2 shows the undershoot and overshoot voltages at the interfaces of the MPC8641.



Note:
1. t_{CLK} references clocks for various functional blocks as follows:

DDR*n* = 10% of D*n*_MCK period
eTSEC*n* = 10% of EC*n*_GTX_CLK125 period
Local Bus = 10% of LCLK[0:2] period
I^2C = 10% of SYSCLK
JTAG = 10% of SYSCLK

Figure 2. Overshoot/Undershoot Voltage for D*n*_M/O/L/TV_{IN}

The MPC8641 core voltage must always be provided at nominal V_{DD}_Core*n* (See Table 2 for actual recommended core voltage). Voltage to the processor interface I/Os are provided through separate sets of supply pins and must be provided at the voltages shown in Table 2. The input voltage threshold scales with respect to the associated I/O supply voltage. OV_{DD} and L/TV_{DD} based receivers are simple CMOS I/O circuits and satisfy appropriate LVCMOS type specifications. The DDR SDRAM interface uses a single-ended differential receiver referenced to each externally supplied D*n*_MV_{REF} signal (nominally set to D*n*_GV_{DD}/2) as is appropriate for the (SSTL-18 and SSTL-25) electrical signaling standards.

8.2.3.2 MII Receive AC Timing Specifications

Table 31 provides the MII receive AC timing specifications.

Table 31. MII Receive AC Timing Specifications

At recommended operating conditions with LV_{DD} of 3.3 V ± 5%.

Parameter/Condition	Symbol [1]	Min	Typ	Max	Unit
RX_CLK clock period 10 Mbps	t_{MRX}[2,3]	—	400	—	ns
RX_CLK clock period 100 Mbps	t_{MRX}[3]	—	40	—	ns
RX_CLK duty cycle	t_{MRXH}/t_{MRX}	35	—	65	%
RXD[3:0], RX_DV, RX_ER setup time to RX_CLK	t_{MRDVKH}	10.0	—	—	ns
RXD[3:0], RX_DV, RX_ER hold time to RX_CLK	t_{MRDXKH}	10.0	—	—	ns
RX_CLK clock rise time (20%-80%)	t_{MRXR}[2]	1.0	—	4.0	ns
RX_CLK clock fall time (80%-20%)	t_{MRXF}[2]	1.0	—	4.0	ns

Note:

1. The symbols used for timing specifications herein follow the pattern of $t_{\text{(first two letters of functional block)(signal)(state) (reference)(state)}}$ for inputs and $t_{\text{(first two letters of functional block)(reference)(state)(signal)(state)}}$ for outputs. For example, t_{MRDVKH} symbolizes MII receive timing (MR) with respect to the time data input signals (D) reach the valid state (V) relative to the t_{MRX} clock reference (K) going to the high (H) state or setup time. Also, t_{MRDXKL} symbolizes MII receive timing (GR) with respect to the time data input signals (D) went invalid (X) relative to the t_{MRX} clock reference (K) going to the low (L) state or hold time. Note that, in general, the clock reference symbol representation is based on three letters representing the clock of a particular functional. For example, the subscript of t_{MRX} represents the MII (M) receive (RX) clock. For rise and fall times, the latter convention is used with the appropriate letter: R (rise) or F (fall).
2. Guaranteed by design.
3. ±100 ppm tolerance on RX_CLK frequency

Figure 14 provides the AC test load for eTSEC.

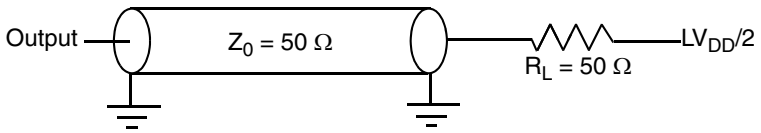


Figure 14. eTSEC AC Test Load

Figure 15 shows the MII receive AC timing diagram.

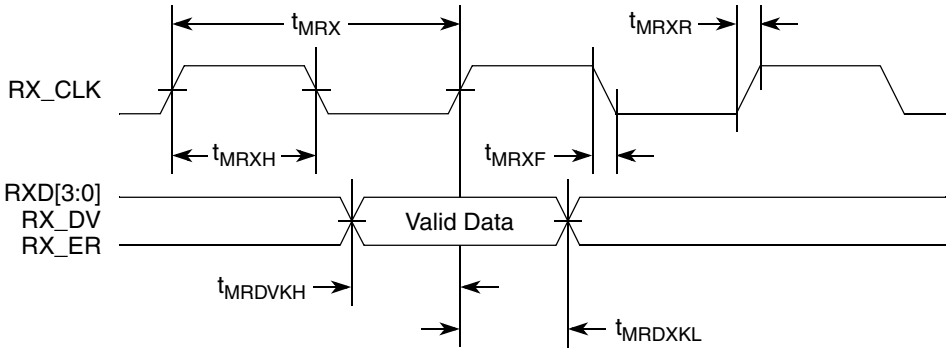

Figure 15. MII Receive AC Timing Diagram

8.2.4 TBI AC Timing Specifications

This section describes the TBI transmit and receive AC timing specifications.

8.2.4.1 TBI Transmit AC Timing Specifications

Table 32 provides the TBI transmit AC timing specifications.

Table 32. TBI Transmit AC Timing Specifications

At recommended operating conditions with L/TV_{DD} of 3.3 V ± 5% and 2.5 V ± 5%.

Parameter/Condition	Symbol [1]	Min	Typ	Max	Unit
TCG[9:0] setup time GTX_CLK going high	t_{TTKHDV}	2.0	—	—	ns
TCG[9:0] hold time from GTX_CLK going high	t_{TTKHDX}	1.0	—	—	ns
GTX_CLK rise time (20%–80%)	t_{TTXR}[2]	—	—	1.0	ns
GTX_CLK fall time (80%–20%)	t_{TTXF}[2]	—	—	1.0	ns

Notes:

1. The symbols used for timing specifications herein follow the pattern of $t_{\text{(first two letters of functional block)(signal)(state)(reference)(state)}}$ for inputs and $t_{\text{(first two letters of functional block)(reference)(state)(signal)(state)}}$ for outputs. For example, t_{TTKHDV} symbolizes the TBI transmit timing (TT) with respect to the time from t_{TTX} (K) going high (H) until the referenced data signals (D) reach the valid state (V) or setup time. Also, t_{TTKHDX} symbolizes the TBI transmit timing (TT) with respect to the time from t_{TTX} (K) going high (H) until the referenced data signals (D) reach the invalid state (X) or hold time. Note that, in general, the clock reference symbol representation is based on three letters representing the clock of a particular functional. For example, the subscript of t_{TTX} represents the TBI (T) transmit (TX) clock. For rise and fall times, the latter convention is used with the appropriate letter: R (rise) or F (fall).
2. Guaranteed by design.

Figure 16 shows the TBI transmit AC timing diagram.

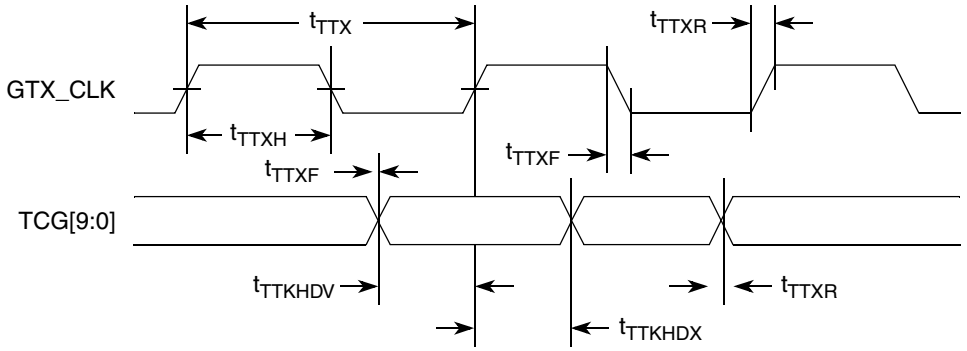

Figure 16. TBI Transmit AC Timing Diagram

9 Ethernet Management Interface Electrical Characteristics

The electrical characteristics specified here apply to MII management interface signals MDIO (management data input/output) and MDC (management data clock). The electrical characteristics for GMII, RGMII, RMII, TBI and RTBI are specified in "Section 8, "Ethernet: Enhanced Three-Speed Ethernet (eTSEC), MII Management."

9.1 MII Management DC Electrical Characteristics

The MDC and MDIO are defined to operate at a supply voltage of 3.3 V. The DC electrical characteristics for MDIO and MDC are provided in Table 38.

Table 38. MII Management DC Electrical Characteristics

Parameter	Symbol	Min	Max	Unit
Supply voltage (3.3 V)	OV_{DD}	3.135	3.465	V
Output high voltage (OV_{DD} = Min, I_{OH} = –1.0 mA)	V_{OH}	2.10	—	V
Output low voltage (OV_{DD} =Min, I_{OL} = 1.0 mA)	V_{OL}	—	0.50	V
Input high voltage	V_{IH}	1.70	—	V
Input low voltage	V_{IL}	—	0.90	V
Input high current (OV_{DD} = Max, V_{IN} [1] = 2.1 V)	I_{IH}	—	40	μA
Input low current (OV_{DD} = Max, V_{IN} = 0.5 V)	I_{IL}	–600	—	μA

Note:
1. Note that the symbol V_{IN}, in this case, represents the OV_{IN} symbol referenced in Table 1 and Table 2.

9.2 MII Management AC Electrical Specifications

Table 39 provides the MII management AC timing specifications.

Table 39. MII Management AC Timing Specifications

At recommended operating conditions with OV_{DD} is 3.3 V ± 5%.

Parameter/Condition	Symbol [1]	Min	Typ	Max	Unit	Notes
MDC frequency	f_{MDC}	2.5	—	9.3	MHz	2, 4
MDC period	t_{MDC}	80	—	400	ns	—
MDC clock pulse width high	t_{MDCH}	32	—	—	ns	—
MDC to MDIO valid	t_{MDKHDV}	$16*t_{MPXCLK}$	—	—	ns	5
MDC to MDIO delay	t_{MDKHDX}	10	—	$16*t_{MPXCLK}$	ns	3, 5
MDIO to MDC setup time	t_{MDDVKH}	5	—	—	ns	—

Table 39. MII Management AC Timing Specifications (continued)

At recommended operating conditions with OV_{DD} is 3.3 V ± 5%.

Parameter/Condition	Symbol [1]	Min	Typ	Max	Unit	Notes
MDIO to MDC hold time	t_{MDDXKH}	0	—	—	ns	—
MDC rise time	t_{MDCR}	—	—	10	ns	4
MDC fall time	t_{MDHF}	—	—	10	ns	4

Notes:

1. The symbols used for timing specifications herein follow the pattern of $t_{\text{(first two letters of functional block)(signal)(state)(reference)(state)}}$ for inputs and $t_{\text{(first two letters of functional block)(reference)(state)(signal)(state)}}$ for outputs. For example, t_{MDKHDX} symbolizes management data timing (MD) for the time t_{MDC} from clock reference (K) high (H) until data outputs (D) are invalid (X) or data hold time. Also, t_{MDDVKH} symbolizes management data timing (MD) with respect to the time data input signals (D) reach the valid state (V) relative to the t_{MDC} clock reference (K) going to the high (H) state or setup time. For rise and fall times, the latter convention is used with the appropriate letter: R (rise) or F (fall).
2. This parameter is dependent on the system clock speed. (The maximum frequency is the maximum platform frequency divided by 64.)
3. This parameter is dependent on the system clock speed. (That is, for a system clock of 267 MHz, the maximum frequency is 8.3 MHz and the minimum frequency is 1.2 MHz; for a system clock of 375 MHz, the maximum frequency is 11.7 MHz and the minimum frequency is 1.7 MHz.)
4. Guaranteed by design.
5. t_{MPXCLK} is the platform (MPX) clock

Figure 23 provides the AC test load for eTSEC.

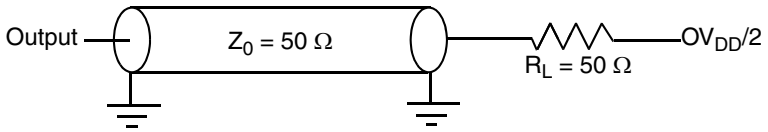

Figure 23. eTSEC AC Test Load

NOTE

Output will see a 50-Ω load since what it sees is the transmission line.

Figure 24 shows the MII management AC timing diagram.

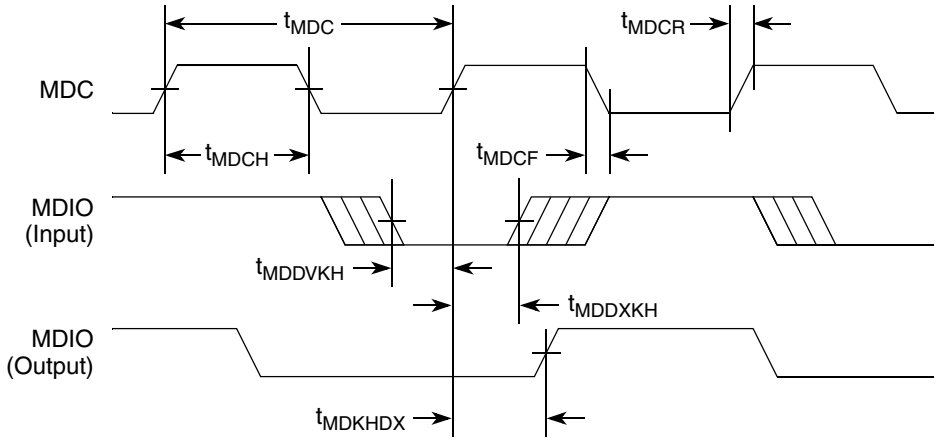

Figure 24. MII Management Interface Timing Diagram

Table 42. Local Bus Timing Parameters—PLL Bypassed (continued)

Parameter	Symbol [1]	Min	Max	Unit	Notes
$\overline{\text{LGTA}}$/LUPWAIT input hold from local bus clock	$t_{LBIXKL2}$	–1.3	—	ns	4, 5
LALE output transition to LAD/LDP output transition (LATCH hold time)	t_{LBOTOT}	1.5	—	ns	6
Local bus clock to output valid (except LAD/LDP and LALE)	$t_{LBKLOV1}$	—	–0.3	ns	
Local bus clock to data valid for LAD/LDP	$t_{LBKLOV2}$	—	–0.1	ns	4
Local bus clock to address valid for LAD	$t_{LBKLOV3}$	—	0	ns	4
Local bus clock to LALE assertion	$t_{LBKLOV4}$	—	0	ns	4
Output hold from local bus clock (except LAD/LDP and LALE)	$t_{LBKLOX1}$	–3.2	—	ns	4
Output hold from local bus clock for LAD/LDP	$t_{LBKLOX2}$	–3.2	—	ns	4
Local bus clock to output high Impedance (except LAD/LDP and LALE)	$t_{LBKLOZ1}$	—	0.2	ns	7
Local bus clock to output high impedance for LAD/LDP	$t_{LBKLOZ2}$	—	0.2	ns	7

Notes:

1. The symbols used for timing specifications herein follow the pattern of $t_{\text{(First two letters of functional block)(signal)(state) (reference)(state)}}$ for inputs and $t_{\text{(First two letters of functional block)(reference)(state)(signal)(state)}}$ for outputs. For example, $t_{LBIXKH1}$ symbolizes local bus timing (LB) for the input (I) to go invalid (X) with respect to the time the t_{LBK} clock reference (K) goes high (H), in this case for clock one(1). Also, t_{LBKHOX} symbolizes local bus timing (LB) for the t_{LBK} clock reference (K) to go high (H), with respect to the output (O) going invalid (X) or output hold time.
2. All timings are in reference to local bus clock for PLL bypass mode. Timings may be negative with respect to the local bus clock because the actual launch and capture of signals is done with the internal launch/capture clock, which precedes LCLK by t_{LBKHKT}.
3. Maximum possible clock skew between a clock LCLK[m] and a relative clock LCLK[n]. Skew measured between complementary signals at $BV_{DD}/2$.
4. All signals are measured from BVDD/2 of the rising edge of local bus clock for PLL bypass mode to 0.4 x BVDD of the signal in question for 3.3-V signaling levels.
5. Input timings are measured at the pin.
6. The value of t_{LBOTOT} is the measurement of the minimum time between the negation of LALE and any change in LAD
7. For purposes of active/float timing measurements, the Hi-Z or off state is defined to be when the total current delivered through the component pin is less than or equal to the leakage current specification.
8. Guaranteed by characterization.

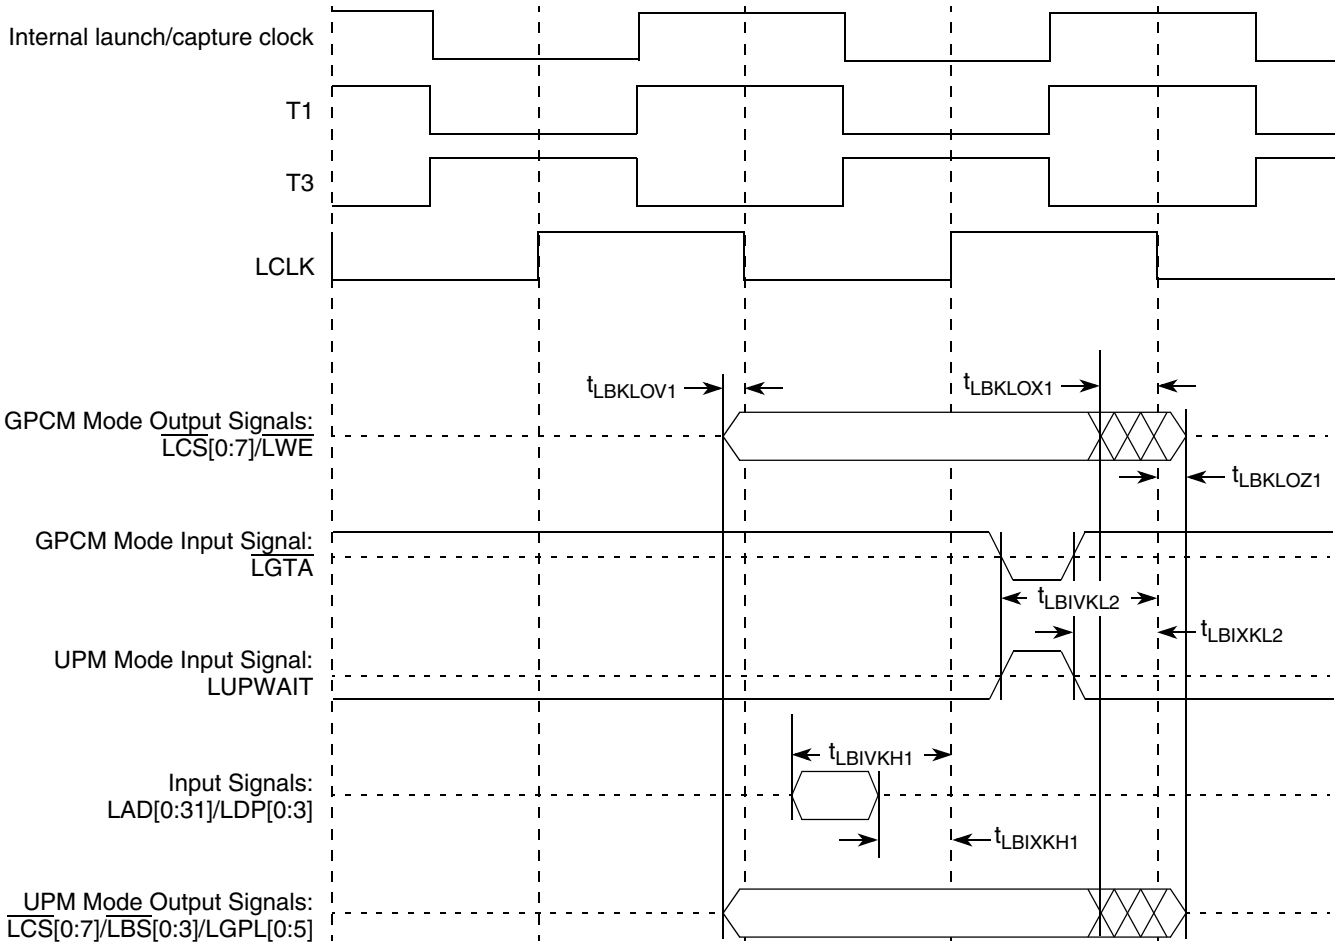

Figure 29. Local Bus Signals, GPCM/UPM Signals for LCRR[CLKDIV] = 2 (clock ratio of 4) (PLL Bypass Mode)

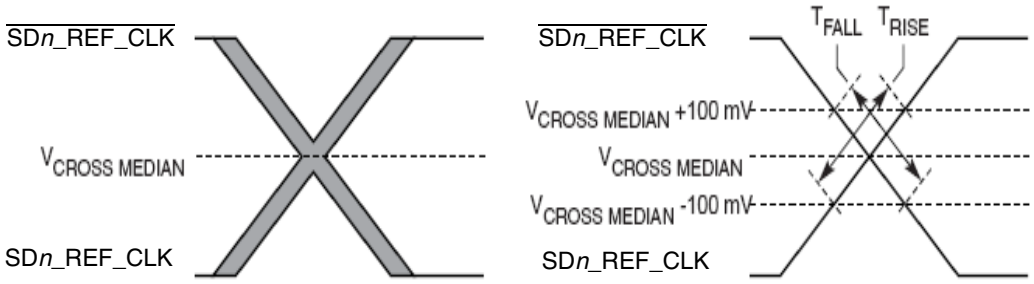

Figure 48. Single-Ended Measurement Points for Rise and Fall Time Matching

The other detailed AC requirements of the SerDes Reference Clocks is defined by each interface protocol based on application usage. Refer to the following sections for detailed information:

- Section 14.2, "AC Requirements for PCI Express SerDes Clocks"
- Section 15.2, "AC Requirements for Serial RapidIO SDn_REF_CLK and SDn_REF_CLK"

13.3 SerDes Transmitter and Receiver Reference Circuits

Figure 49 shows the reference circuits for SerDes data lane's transmitter and receiver.

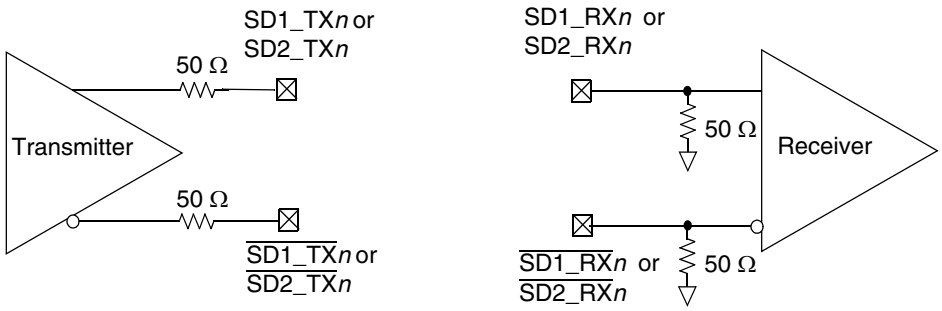

Figure 49. SerDes Transmitter and Receiver Reference Circuits

The DC and AC specification of SerDes data lanes are defined in each interface protocol section below (PCI Express or Serial Rapid IO) in this document based on the application usage:"

- Section 14, "PCI Express"
- Section 15, "Serial RapidIO"

Note that external AC Coupling capacitor is required for the above two serial transmission protocols with the capacitor value defined in specification of each protocol section.

14 PCI Express

This section describes the DC and AC electrical specifications for the PCI Express bus of the MPC8641.

Table 49. Differential Transmitter (TX) Output Specifications (continued)

Symbol	Parameter	Min	Nom	Max	Units	Comments
$T_{TX-IDLE-SET-TO-IDLE}$	Maximum time to transition to a valid Electrical idle after sending an Electrical Idle ordered set	—	—	20	UI	After sending an Electrical Idle ordered set, the Transmitter must meet all Electrical Idle Specifications within this time. This is considered a debounce time for the Transmitter to meet Electrical Idle after transitioning from L0.
$T_{TX-IDLE-TO-DIFF-DATA}$	Maximum time to transition to valid TX specifications after leaving an Electrical idle condition	—	—	20	UI	Maximum time to meet all TX specifications when transitioning from Electrical Idle to sending differential data. This is considered a debounce time for the TX to meet all TX specifications after leaving Electrical Idle
$RL_{TX-DIFF}$	Differential Return Loss	12	—	—	dB	Measured over 50 MHz to 1.25 GHz. See Note 4
RL_{TX-CM}	Common Mode Return Loss	6	—	—	dB	Measured over 50 MHz to 1.25 GHz. See Note 4
$Z_{TX-DIFF-DC}$	DC Differential TX Impedance	80	100	120	Ω	TX DC Differential mode Low Impedance
Z_{TX-DC}	Transmitter DC Impedance	40	—	—	Ω	Required TX D+ as well as D- DC Impedance during all states
$L_{TX-SKEW}$	Lane-to-Lane Output Skew	—	—	500 + 2 UI	ps	Static skew between any two Transmitter Lanes within a single Link
C_{TX}	AC Coupling Capacitor	75	—	—	nF	All Transmitters shall be AC coupled. The AC coupling is required either within the media or within the transmitting component itself. See Note 8.
$T_{crosslink}$	Crosslink Random Timeout	0	—	—	ms	This random timeout helps resolve conflicts in crosslink configuration by eventually resulting in only one Downstream and one Upstream Port. See Note 7.

Notes:

1. No test load is necessarily associated with this value.
2. Specified at the measurement point into a timing and voltage compliance test load as shown in Figure 52 and measured over any 250 consecutive TX UIs. (Also refer to the transmitter compliance eye diagram shown in Figure 50)
3. A T_{TX-EYE} = 0.70 UI provides for a total sum of deterministic and random jitter budget of $T_{TX-JITTER-MAX}$ = 0.30 UI for the Transmitter collected over any 250 consecutive TX UIs. The $T_{TX-EYE-MEDIAN-to-MAX-JITTER}$ median is less than half of the total TX jitter budget collected over any 250 consecutive TX UIs. It should be noted that the median is not the same as the mean. The jitter median describes the point in time where the number of jitter points on either side is approximately equal as opposed to the averaged time value.
4. The Transmitter input impedance shall result in a differential return loss greater than or equal to 12 dB and a common mode return loss greater than or equal to 6 dB over a frequency range of 50 MHz to 1.25 GHz. This input impedance requirement applies to all valid input levels. The reference impedance for return loss measurements is 50 Ω to ground for both the D+ and D- line (that is, as measured by a Vector Network Analyzer with 50 ohm probes—see Figure 52). Note that the series capacitors C_{TX} is optional for the return loss measurement.
5. Measured between 20-80% at transmitter package pins into a test load as shown in Figure 52 for both V_{TX-D+} and V_{TX-D-}.
6. See Section 4.3.1.8 of the PCI Express Base Specifications Rev 1.0a
7. See Section 4.2.6.3 of the PCI Express Base Specifications Rev 1.0a
8. MPC8641D SerDes transmitter does not have C_{TX} built-in. An external AC Coupling capacitor is required.

15.4 Equalization

With the use of high speed serial links, the interconnect media will cause degradation of the signal at the receiver. Effects such as Inter-Symbol Interference (ISI) or data dependent jitter are produced. This loss can be large enough to degrade the eye opening at the receiver beyond what is allowed in the specification. To negate a portion of these effects, equalization can be used. The most common equalization techniques that can be used are:

- A passive high pass filter network placed at the receiver. This is often referred to as passive equalization.
- The use of active circuits in the receiver. This is often referred to as adaptive equalization.

15.5 Explanatory Note on Transmitter and Receiver Specifications

AC electrical specifications are given for transmitter and receiver. Long run and short run interfaces at three baud rates (a total of six cases) are described.

The parameters for the AC electrical specifications are guided by the XAUI electrical interface specified in Clause 47 of IEEE 802.3ae-2002.

XAUI has similar application goals to serial RapidIO, as described in Section 8.1. The goal of this standard is that electrical designs for serial RapidIO can reuse electrical designs for XAUI, suitably modified for applications at the baud intervals and reaches described herein.

15.6 Transmitter Specifications

LP-Serial transmitter electrical and timing specifications are stated in the text and tables of this section.

The differential return loss, S11, of the transmitter in each case shall be better than

- –10 dB for (Baud Frequency)/10 < Freq(f) < 625 MHz, and
- –10 dB + 10log(f/625 MHz) dB for 625 MHz ≤ Freq(f) ≤ Baud Frequency

The reference impedance for the differential return loss measurements is 100 Ohm resistive. Differential return loss includes contributions from on-chip circuitry, chip packaging and any off-chip components related to the driver. The output impedance requirement applies to all valid output levels.

It is recommended that the 20%–80% rise/fall time of the transmitter, as measured at the transmitter output, in each case have a minimum value 60 ps.

It is recommended that the timing skew at the output of an LP-Serial transmitter between the two signals that comprise a differential pair not exceed 25 ps at 1.25 GB, 20 ps at 2.50 GB and 15 ps at 3.125 GB.

Table 57. Long Run Transmitter AC Timing Specifications—3.125 GBaud

Characteristic	Symbol	Range		Unit	Notes
		Min	Max		
Output Voltage,	V_O	–0.40	2.30	Volts	Voltage relative to COMMON of either signal comprising a differential pair
Differential Output Voltage	V_{DIFFPP}	800	1600	mV p-p	—
Deterministic Jitter	J_D	—	0.17	UI p-p	—
Total Jitter	J_T	—	0.35	UI p-p	—
Multiple output skew	S_{MO}	—	1000	ps	Skew at the transmitter output between lanes of a multilane link
Unit Interval	UI	320	320	ps	+/– 100 ppm

For each baud rate at which an LP-Serial transmitter is specified to operate, the output eye pattern of the transmitter shall fall entirely within the unshaded portion of the Transmitter Output Compliance Mask shown in Figure 54 with the parameters specified in Table 58 when measured at the output pins of the device and the device is driving a 100 Ω +/–5% differential resistive load. The output eye pattern of an LP-Serial transmitter that implements pre-emphasis (to equalize the link and reduce inter-symbol interference) need only comply with the Transmitter Output Compliance Mask when pre-emphasis is disabled or minimized.

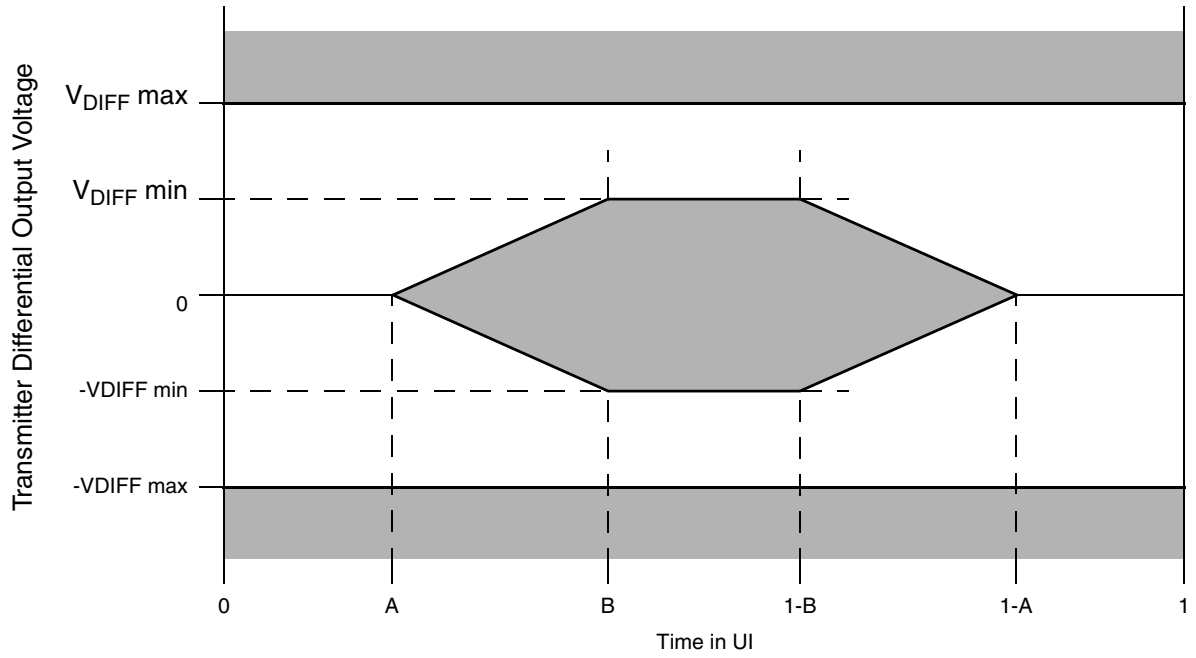

Figure 54. Transmitter Output Compliance Mask

16.2 Mechanical Dimensions of the MPC8641 FC-CBGA

The mechanical dimensions and bottom surface nomenclature of the MPC8641D (dual core) and MPC8641 (single core) high-lead FC-CBGA (package option: HCTE HX) and lead-free FC-CBGA (package option: HCTE VU) are shown respectfully in Figure 57 and Figure 58.

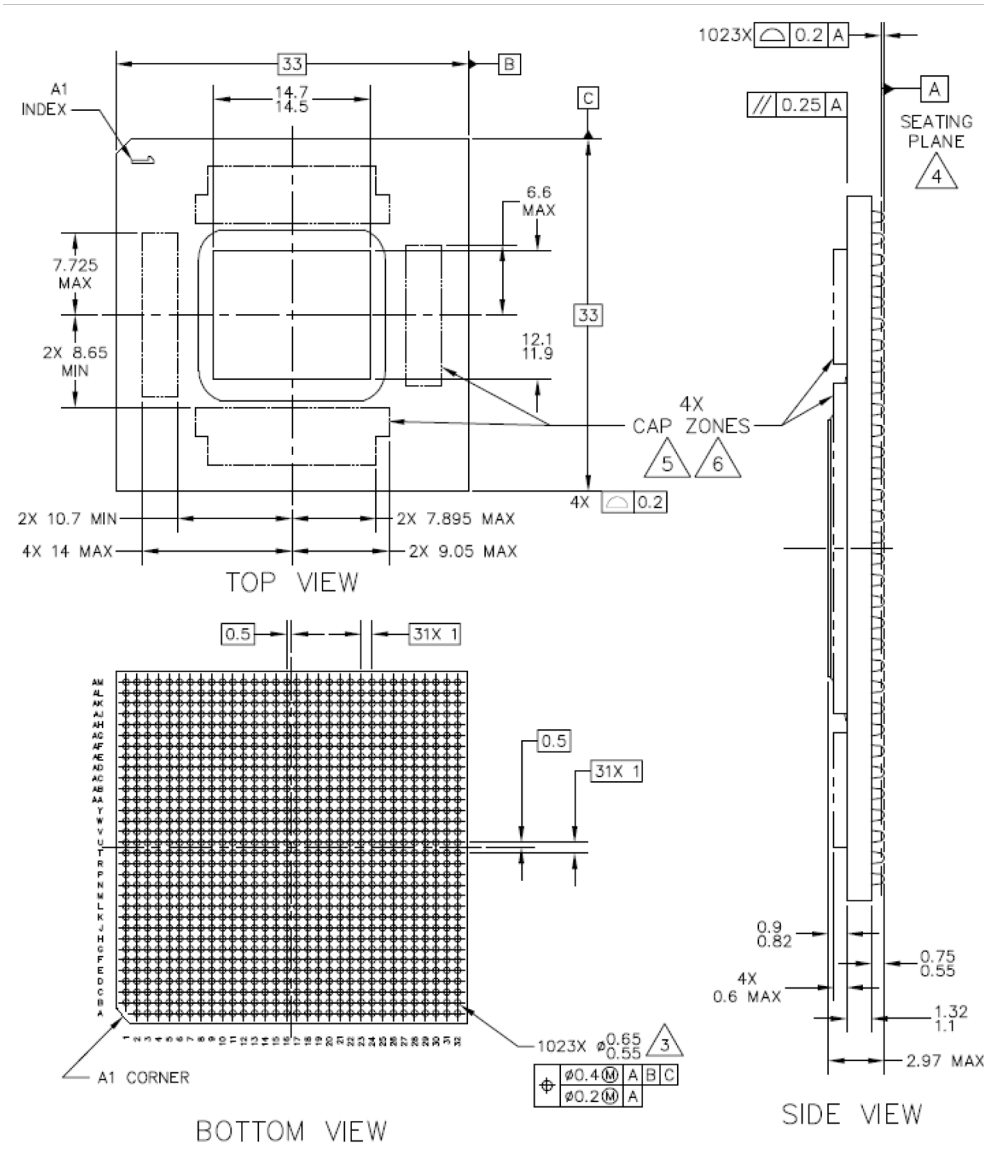

Figure 57. MPC8641D High-Head FC-CBGA Dimensions

NOTES for Figure 57

1. All dimensions are in millimeters.
2. Dimensions and tolerances per ASME Y14.5M-1994.
3. Maximum solder ball diameter measured parallel to datum A.
4. Datum A, the seating plane, is defined by the spherical crowns of the solder balls.
5. Capacitors may not be present on all devices.
6. Caution must be taken not to short capacitors or expose metal capacitor pads on package top.
7. All dimensions symmetrical about centerlines unless otherwise specified.

Table 63. MPC8641 Signal Reference by Functional Block (continued)

Name[1]	Package Pin Number	Pin Type	Power Supply	Notes
$SENSEV_{SS}$_Core0	P14	Core0 GND sensing pin	—	31
$SENSEV_{SS}$_Core1	V20	Core1 GND sensing pin	—	12, 31, *S3*
$SENSEV_{DD}$_PLAT	N18	V_{DD}_PLAT sensing pin	—	28
$SENSEV_{SS}$_PLAT	P18	Platform GND sensing pin	—	29
$D1\_GV_{DD}$	B11, B14, D10, D13, F9, F12, H8, H11, H14, K10, K13, L8, P8, R6, U8, V6, W10, Y8, AA6, AB10, AC8, AD12, AE10, AF8, AG12, AH10, AJ8, AJ14, AK12, AL10, AL16	SDRAM 1 I/O supply	$D1\_GV_{DD}$ 2.5 - DDR 1.8 DDR2	—
$D2\_GV_{DD}$	B2, B5, B8, D4, D7, E2, F6, G4, H2, J6, K4, L2, M6, N4, P2, T4, U2, W4, Y2, AB4, AC2, AD6, AE4, AF2, AG6, AH4, AJ2, AK6, AL4, AM2	SDRAM 2 I/O supply	$D2\_GV_{DD}$ 2.5 V - DDR 1.8 V - DDR2	—

Table 63. MPC8641 Signal Reference by Functional Block (continued)

Name[1]	Package Pin Number	Pin Type	Power Supply	Notes

Note:

1. Multi-pin signals such as D1_MDQ[0:63] and D2_MDQ[0:63] have their physical package pin numbers listed in order corresponding to the signal names.
2. Stub Series Terminated Logic (SSTL-18 and SSTL-25) type pins.
3. If a DDR port is not used, it is possible to leave the related power supply (Dn_GVDD, Dn_MVREF) turned off at reset. Note that these power supplies can only be powered up again at reset for functionality to occur on the DDR port.
4. Low Voltage Differential Signaling (LVDS) type pins.
5. Low Voltage Transistor-Transistor Logic (LVTTL) type pins.
6. This pin is a reset configuration pin and appears again in the Reset Configuration Signals section of this table. See the Reset Configuration Signals section of this table for config name and connection details.
7. Recommend a weak pull-up resistor (1–10 kΩ) be placed from this pin to its power supply.
8. Recommend a weak pull-down resistor (2–10 kΩ) be placed from this pin to ground.
9. This multiplexed pin has input status in one mode and output in another
10. This pin is a multiplexed signal for different functional blocks and appears more than once in this table.
11. This pin is open drain signal.
12. Functional only on the MPC8641D.
13. These pins should be left floating.
14. These pins should be connected to SV_{DD}.
15. These pins should be pulled to ground with a strong resistor (270-Ω to 330-Ω).
16. These pins should be connected to OVDD.
17. This is a SerDes PLL/DLL digital test signal and is only for factory use.
18. This is a SerDes PLL/DLL analog test signal and is only for factory use.
19. This pin should be pulled to ground with a 100-Ω resistor.
20. The pins in this section are reset configuration pins. Each pin has a weak internal pull-up P-FET which is enabled only when the processor is in the reset state. This pull-up is designed such that it can be overpowered by an external 4.7-kΩ pull-down resistor. However, if the signal is intended to be high after reset, and if there is any device on the net which might pull down the value of the net at reset, then a pullup or active driver is needed.
21. Should be pulled down at reset if platform frequency is at 400 MHz.
22. These pins require 4.7-kΩ pull-up or pull-down resistors and must be driven as they are used to determine PLL configuration ratios at reset.
23. This output is actively driven during reset rather than being tri-stated during reset.
24 These JTAG pins have weak internal pull-up P-FETs that are always enabled.
25. This pin should NOT be pulled down (or driven low) during reset.
26. These are test signals for factory use only and must be pulled up (100-Ω to 1- kΩ) to OVDD for normal machine operation.
27. Dn_MDIC[0] should be connected to ground with an 18-Ω resistor +/– 1-Ω and Dn_MDIC[1] should be connected Dn_GVDD with an 18-Ω resistor +/– 1-Ω. These pins are used for automatic calibration of the DDR IOs.
28. Pin N18 is recommended as a reference point for determining the voltage of V_{DD}_PLAT and is hence considered as the V_{DD}_PLAT sensing voltage and is called SENSEVDD_PLAT.
29. Pin P18 is recommended as the ground reference point for SENSEVDD_PLAT and is called SENSEVSS_PLAT.
30. This pin should be pulled to ground with a 200-Ω resistor.
31. These pins are connected to the power/ground planes internally and may be used by the core power supply to improve tracking and regulation.
32. Must be tied low if unused
33. These pins may be used as defined functional reset configuration pins in the future. Please include a resistor pull up/down option to allow flexibility of future designs.
34. Used as serial data output for SRIO 1x/4x link.
35. Used as serial data input for SRIO 1x/4x link.
36. This pin requires an external 4.7-kΩ pull-down resistor to pevent PHY from seeing a valid Transmit Enable before it is actively driven.

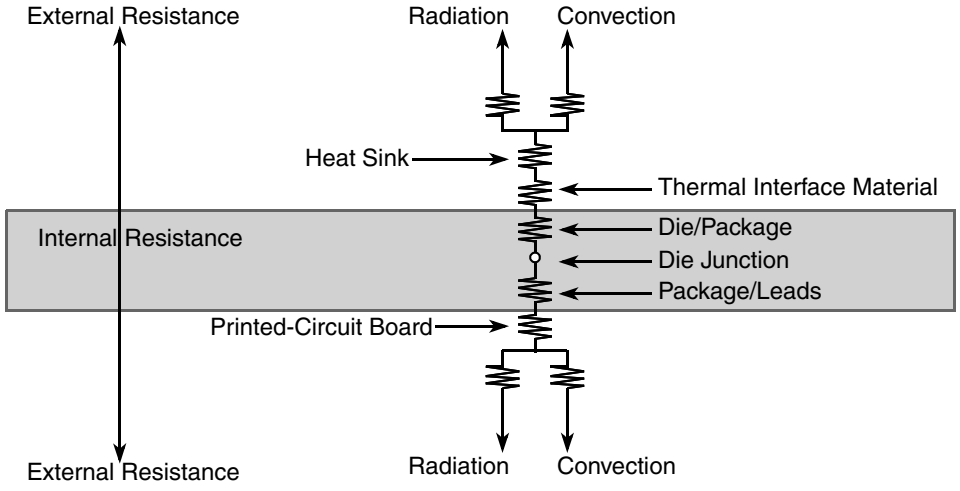
Ultimately, the final selection of an appropriate heat sink depends on many factors, such as thermal performance at a given air velocity, spatial volume, mass, attachment method, assembly, and cost.

19.2.1 Internal Package Conduction Resistance

For the exposed-die packaging technology described in Table 71, the intrinsic conduction thermal resistance paths are as follows:

- The die junction-to-case thermal resistance (the case is actually the top of the exposed silicon die)
- The die junction-to-board thermal resistance

Figure 60 depicts the primary heat transfer path for a package with an attached heat sink mounted to a printed-circuit board.



(Note the internal versus external package resistance.)

Figure 60. C4 Package with Heat Sink Mounted to a Printed-Circuit Board

Heat generated on the active side of the chip is conducted through the silicon, through the heat sink attach material (or thermal interface material), and finally to the heat sink where it is removed by forced-air convection.

Because the silicon thermal resistance is quite small, the temperature drop in the silicon may be neglected for a first-order analysis. Thus the thermal interface material and the heat sink conduction/convective thermal resistances are the dominant terms.

Another useful equation is:

$$V_H - V_L = n\frac{KT}{q}\left[ln\frac{I_H}{I_L}\right]$$

Where:

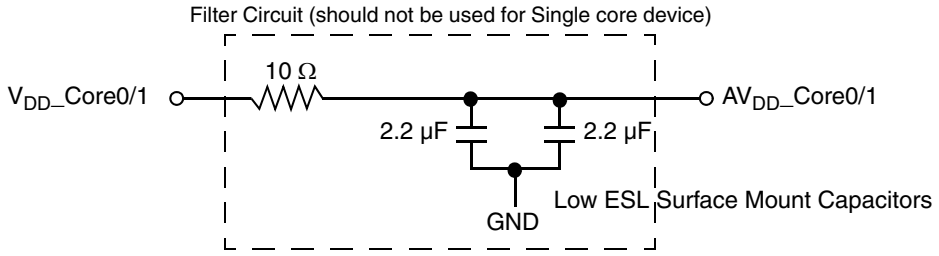
I_{fw} = Forward current
I_s = Saturation current
V_d = Voltage at diode
V_f = Voltage forward biased
V_H = Diode voltage while I_H is flowing
V_L = Diode voltage while I_L is flowing
I_H = Larger diode bias current
I_L = Smaller diode bias current
q = Charge of electron (1.6×10^{-19} C)
n = Ideality factor (normally 1.0)
K = Boltzman's constant (1.38×10^{-23} Joules/K)
T = Temperature (Kelvins)

The ratio of I_H to I_L is usually selected to be 10:1. The above simplifies to the following:

$$V_H - V_L = 1.986 \times 10^{-4} \times nT$$

Solving for T, the equation becomes:

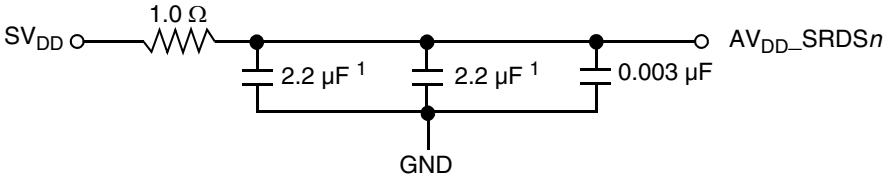
$$nT = \frac{V_H - V_L}{1.986 \times 10^{-4}}$$



Note: For single core device the filter circuit (in the dashed box) should be removed and AV_{DD}_Core1 should be tied to ground with a weak (2-10 kΩ) pull-down resistor.

Figure 64. MPC8641 PLL Power Supply Filter Circuit (for cores)

The AV_{DD}_SRDS*n* signals provide power for the analog portions of the SerDes PLL. To ensure stability of the internal clock, the power supplied to the PLL is filtered using a circuit similar to the one shown in following figure. For maximum effectiveness, the filter circuit is placed as closely as possible to the AV_{DD}_SRDS*n* balls to ensure it filters out as much noise as possible. The ground connection should be near the AV_{DD}_SRDS*n* balls. The 0.003-µF capacitor is closest to the balls, followed by the two 2.2-µF capacitors, and finally the 1 Ω resistor to the board supply plane. The capacitors are connected from AV_{DD}_SRDS*n* to the ground plane. Use ceramic chip capacitors with the highest possible self-resonant frequency. All traces should be kept short, wide and direct.



1. An 0805 sized capacitor is recommended for system initial bring-up.

Figure 65. SerDes PLL Power Supply Filter

Note the following:

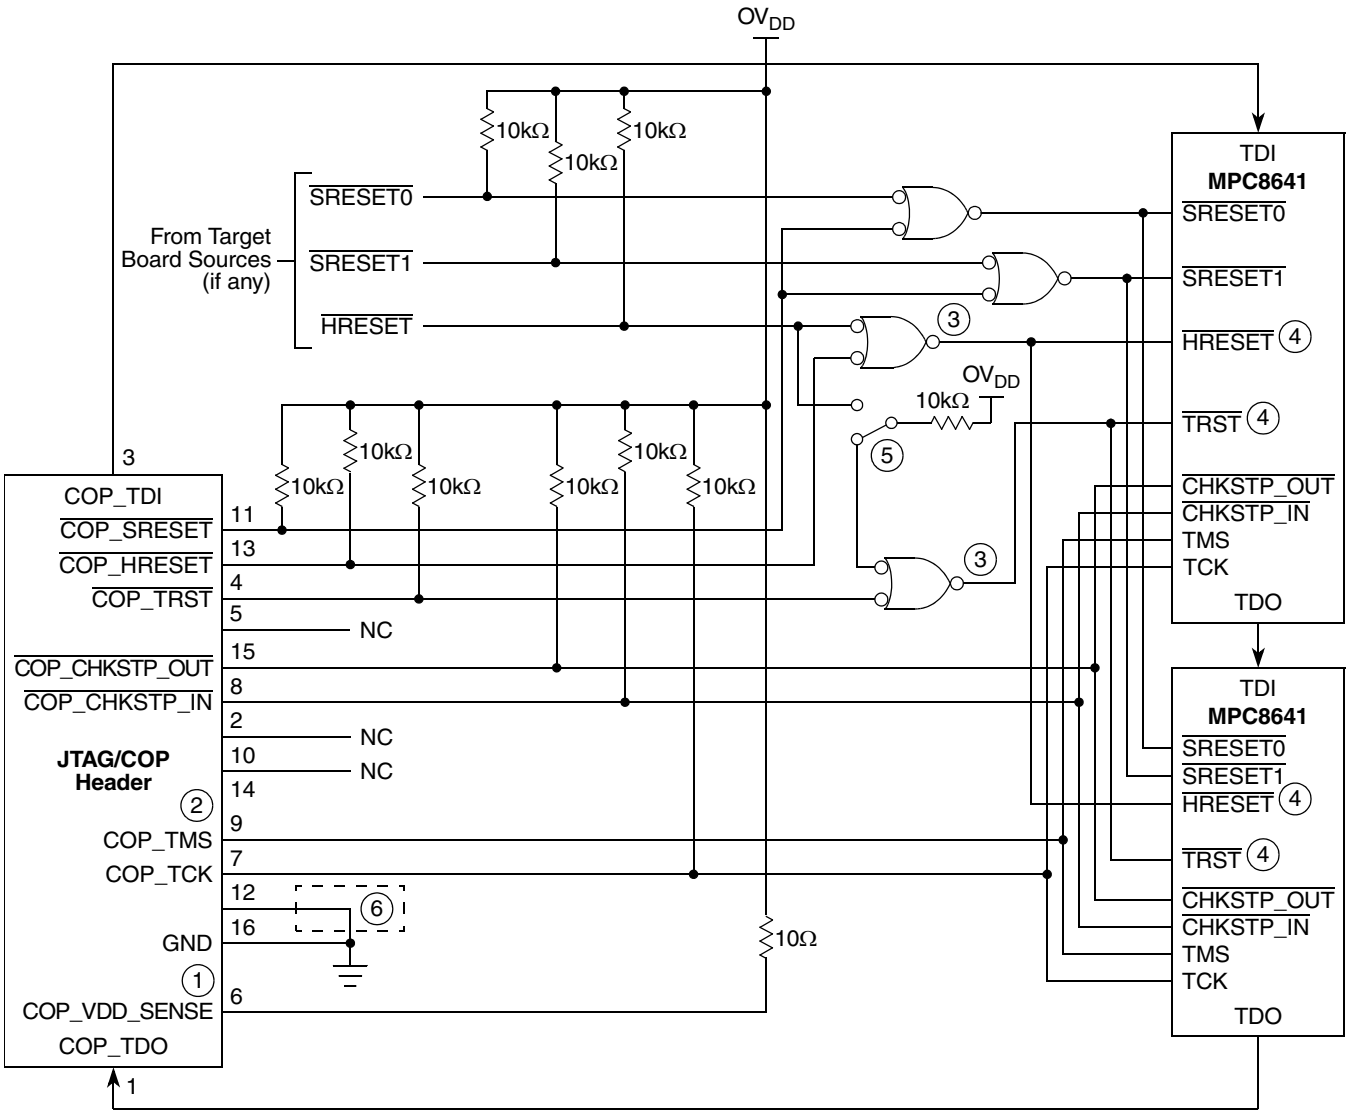
- AV_{DD}_SRDS*n* should be a filtered version of SV_{DD}.
- Signals on the SerDes interface are fed from the SV_{DD} power plan.

20.2.2 PLL Power Supply Sequencing

For details on power sequencing for the AV_{DD} type and supplies refer to Section 2.2, "Power Up/Down Sequence."

20.3 Decoupling Recommendations

Due to large address and data buses, and high operating frequencies, the device can generate transient power surges and high frequency noise in its power supply, especially while driving large capacitive loads. This noise must be prevented from reaching other components in the MPC8641 system, and the device itself requires a clean, tightly regulated source of power. Therefore, it is recommended that the system



Notes:

1. Populate this with a 10Ω resistor for short circuit/current-limiting protection.
2. KEY location; pin 14 is not physically present on the COP header.
3. Use a AND gate with sufficient drive strength to drive two inputs.
4. The COP port and target board should be able to independently assert $\overline{\text{HRESET}}$ and $\overline{\text{TRST}}$ to the processor in order to fully control the processor as shown above.
5. This switch is included as a precaution for BSDL testing. The switch should be open during BSDL testing to avoid accidentally asserting the $\overline{\text{TRST}}$ line. If BSDL testing is not being performed, this switch should be closed or removed.
6. Although pin 12 is defined as a No-Connect, some debug tools may use pin 12 as an additional GND pin for improved signal integrity.
