
Welcome to E-XFL.COM

What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Active
Core Processor	PIC
Core Size	16-Bit
Speed	32MHz
Connectivity	I²C, PMP, SPI, UART/USART
Peripherals	Brown-out Detect/Reset, POR, PWM, WDT
Number of I/O	53
Program Memory Size	192KB (65.5K x 24)
Program Memory Type	FLASH
EEPROM Size	-
RAM Size	16K x 8
Voltage - Supply (Vcc/Vdd)	2V ~ 3.6V
Data Converters	A/D 16x10b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 125°C (TA)
Mounting Type	Surface Mount
Package / Case	64-VFQFN Exposed Pad
Supplier Device Package	64-VQFN (9x9)
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/pic24fj192ga106-e-mr

PIC24FJ256GA110 FAMILY

64/80/100-Pin, 16-Bit, General Purpose Flash Microcontrollers with Peripheral Pin Select

Power Management:

- On-Chip 2.5V Voltage Regulator
- Switch between Clock Sources in Real Time
- Idle, Sleep and Doze modes with Fast Wake-up and Two-Speed Start-up
- Run mode: 1 mA/MIPS, 2.0V Typical
- Standby Current with 32 kHz Oscillator: 2.6 μA, 2.0V Typical

High-Performance CPU:

- Modified Harvard Architecture
- Up to 16 MIPS Operation at 32 MHz
- 8 MHz Internal Oscillator
- 17-Bit x 17-Bit Single-Cycle Hardware Multiplier
- 32-Bit by 16-Bit Hardware Divider
- 16 x 16-Bit Working Register Array
- C Compiler Optimized Instruction Set Architecture with Flexible Addressing modes
- Linear Program Memory Addressing, Up to 12 Mbytes
- Linear Data Memory Addressing, Up to 64 Kbytes
- Two Address Generation Units for Separate Read and Write Addressing of Data Memory

Analog Features:

- 10-Bit, Up to 16-Channel Analog-to-Digital (A/D) Converter at 500 ksps:
  - Conversions available in Sleep mode
- Three Analog Comparators with Programmable Input/Output Configuration
- Charge Time Measurement Unit (CTMU)

Peripheral Features:

- Peripheral Pin Select:
  - Allows independent I/O mapping of many peripherals at run time
  - Continuous hardware integrity checking and safety interlocks prevent unintentional configuration changes
  - Up to 46 available pins (100-pin devices)
- Three 3-Wire/4-Wire SPI modules (supports 4 Frame modes) with 8-Level FIFO Buffer
- Three I^{2}C™ modules support Multi-Master/Slave modes and 7-Bit/10-Bit Addressing
- Four UART modules:
  - Supports RS-485, RS-232, LIN/J2602 protocols and IrDA®
  - On-chip hardware encoder/decoder for IrDA
  - Auto-wake-up and Auto-Baud Detect (ABD)
  - 4-level deep FIFO buffer
- Five 16-Bit Timers/Counters with Programmable Prescaler
- Nine 16-Bit Capture Inputs, each with a Dedicated Time Base
- Nine 16-Bit Compare/PWM Outputs, each with a Dedicated Time Base
- 8-Bit Parallel Master Port (PMP/PSP):
  - Up to 16 address pins
  - Programmable polarity on control lines
- Hardware Real-Time Clock/Calendar (RTCC):
  - Provides clock, calendar and alarm functions
- Programmable Cyclic Redundancy Check (CRC) Generator
- Up to 5 External Interrupt Sources

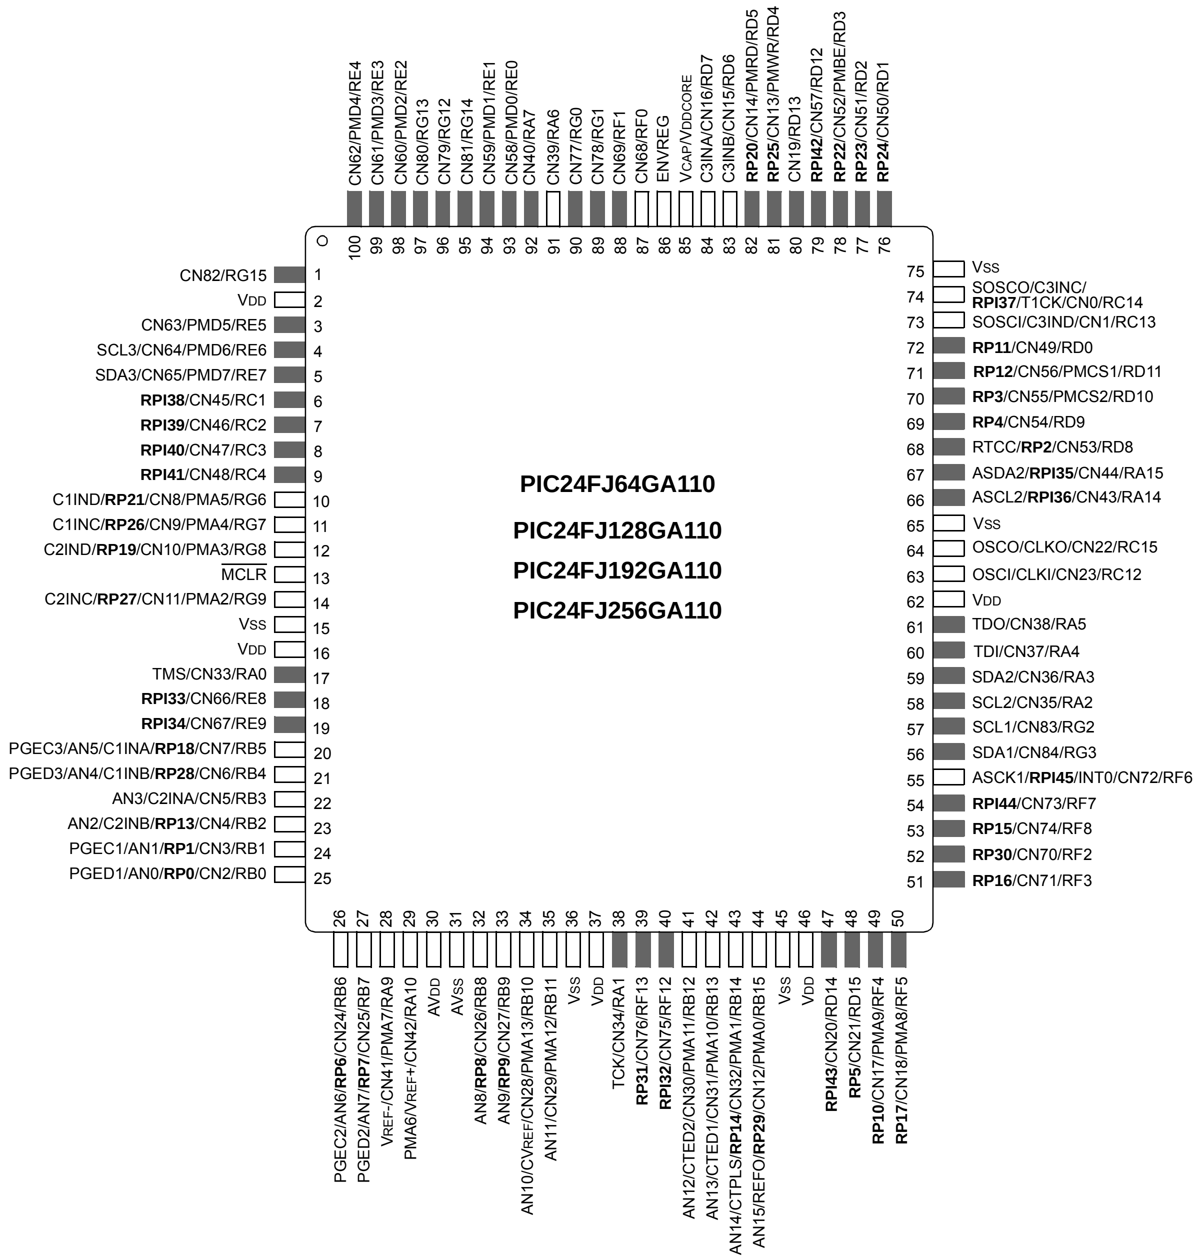
Pin Diagram (100-Pin TQFP)



Legend: **Shaded pins** indicate pins tolerant to up to +5.5 VDC.
RPn represents remappable pins for Peripheral Pin Select (PPS) feature.

3.3 Arithmetic Logic Unit (ALU)

The PIC24F ALU is 16 bits wide and is capable of addition, subtraction, bit shifts and logic operations. Unless otherwise mentioned, arithmetic operations are 2's complement in nature. Depending on the operation, the ALU may affect the values of the Carry (C), Zero (Z), Negative (N), Overflow (OV) and Digit Carry (DC) Status bits in the SR register. The C and DC Status bits operate as Borrow and Digit Borrow bits, respectively, for subtraction operations.

The ALU can perform 8-bit or 16-bit operations, depending on the mode of the instruction that is used. Data for the ALU operation can come from the W register array, or data memory, depending on the addressing mode of the instruction. Likewise, output data from the ALU can be written to the W register array or a data memory location.

The PIC24F CPU incorporates hardware support for both multiplication and division. This includes a dedicated hardware multiplier and support hardware for 16-bit divisor division.

3.3.1 MULTIPLIER

The ALU contains a high-speed, 17-bit x 17-bit multiplier. It supports unsigned, signed or mixed sign operation in several multiplication modes:

1. 16-bit x 16-bit signed
2. 16-bit x 16-bit unsigned
3. 16-bit signed x 5-bit (literal) unsigned
4. 16-bit unsigned x 16-bit unsigned
5. 16-bit unsigned x 5-bit (literal) unsigned
6. 16-bit unsigned x 16-bit signed
7. 8-bit unsigned x 8-bit unsigned

3.3.2 DIVIDER

The divide block supports signed and unsigned integer divide operations with the following data sizes:

1. 32-bit signed/16-bit signed divide
2. 32-bit unsigned/16-bit unsigned divide
3. 16-bit signed/16-bit signed divide
4. 16-bit unsigned/16-bit unsigned divide

The quotient for all divide instructions ends up in W0 and the remainder in W1. Sixteen-bit signed and unsigned `DIV` instructions can specify any W register for both the 16-bit divisor (Wn), and any W register (aligned) pair (W(m + 1):Wm) for the 32-bit dividend. The divide algorithm takes one cycle per bit of divisor, so both 32-bit/16-bit and 16-bit/16-bit instructions take the same number of cycles to execute.

3.3.3 MULTI-BIT SHIFT SUPPORT

The PIC24F ALU supports both single bit and single-cycle, multi-bit arithmetic and logic shifts. Multi-bit shifts are implemented using a shifter block, capable of performing up to a 15-bit arithmetic right shift, or up to a 15-bit left shift, in a single cycle. All multi-bit shift instructions only support Register Direct Addressing for both the operand source and result destination.

A full summary of instructions that use the shift operation is provided below in Table 3-2.

TABLE 3-2: INSTRUCTIONS THAT USE THE SINGLE AND MULTI-BIT SHIFT OPERATION

Instruction	Description
ASR	Arithmetic shift right source register by one or more bits.
SL	Shift left source register by one or more bits.
LSR	Logical shift right source register by one or more bits.

NOTES:

TABLE 7-2: IMPLEMENTED INTERRUPT VECTORS (CONTINUED)

7.3 Interrupt Control and Status Registers

The PIC24FJ256GA110 family of devices implements a total of 37 registers for the interrupt controller:

- INTCON1
- INTCON2
- IFS0 through IFS5
- IEC0 through IEC5
- IPC0 through IPC23 (except IPC14 and IPC17)
- INTTREG

Global interrupt control functions are controlled from INTCON1 and INTCON2. INTCON1 contains the Interrupt Nesting Disable (NSTDIS) bit, as well as the control and status flags for the processor trap sources. The INTCON2 register controls the external interrupt request signal behavior and the use of the Alternate Interrupt Vector Table.

The IFSx registers maintain all of the interrupt request flags. Each source of interrupt has a status bit which is set by the respective peripherals, or an external signal, and is cleared via software.

The IECx registers maintain all of the interrupt enable bits. These control bits are used to individually enable interrupts from the peripherals or external signals.

The IPCx registers are used to set the interrupt priority level for each source of interrupt. Each user interrupt source can be assigned to one of eight priority levels.

The INTTREG register contains the associated interrupt vector number and the new CPU interrupt priority level, which are latched into the Vector Number (VECNUM<6:0>) and the Interrupt Level (ILR<3:0>) bit fields in the INTTREG register. The new interrupt priority level is the priority of the pending interrupt.

The interrupt sources are assigned to the IFSx, IECx and IPCx registers in the order of their vector numbers, as shown in Table 7-2. For example, the INT0 (External Interrupt 0) is shown as having a vector number and a natural order priority of 0. Thus, the INT0IF status bit is found in IFS0<0>, the INT0IE enable bit in IEC0<0> and the INT0IP<2:0> priority bits in the first position of IPC0 (IPC0<2:0>).

Although they are not specifically part of the interrupt control hardware, two of the CPU control registers contain bits that control interrupt functionality. The ALU STATUS Register (SR) contains the IPL<2:0> bits (SR<7:5>); these indicate the current CPU interrupt priority level. The user may change the current CPU priority level by writing to the IPL bits.

The CORCON register contains the IPL3 bit, which together with IPL<2:0>, indicates the current CPU priority level. IPL3 is a read-only bit so that trap events cannot be masked by the user software.

All interrupt registers are described in Register 7-1 through Register 7-38, on the following pages.

REGISTER 7-22: IPC5: INTERRUPT PRIORITY CONTROL REGISTER 5

8.0 OSCILLATOR CONFIGURATION

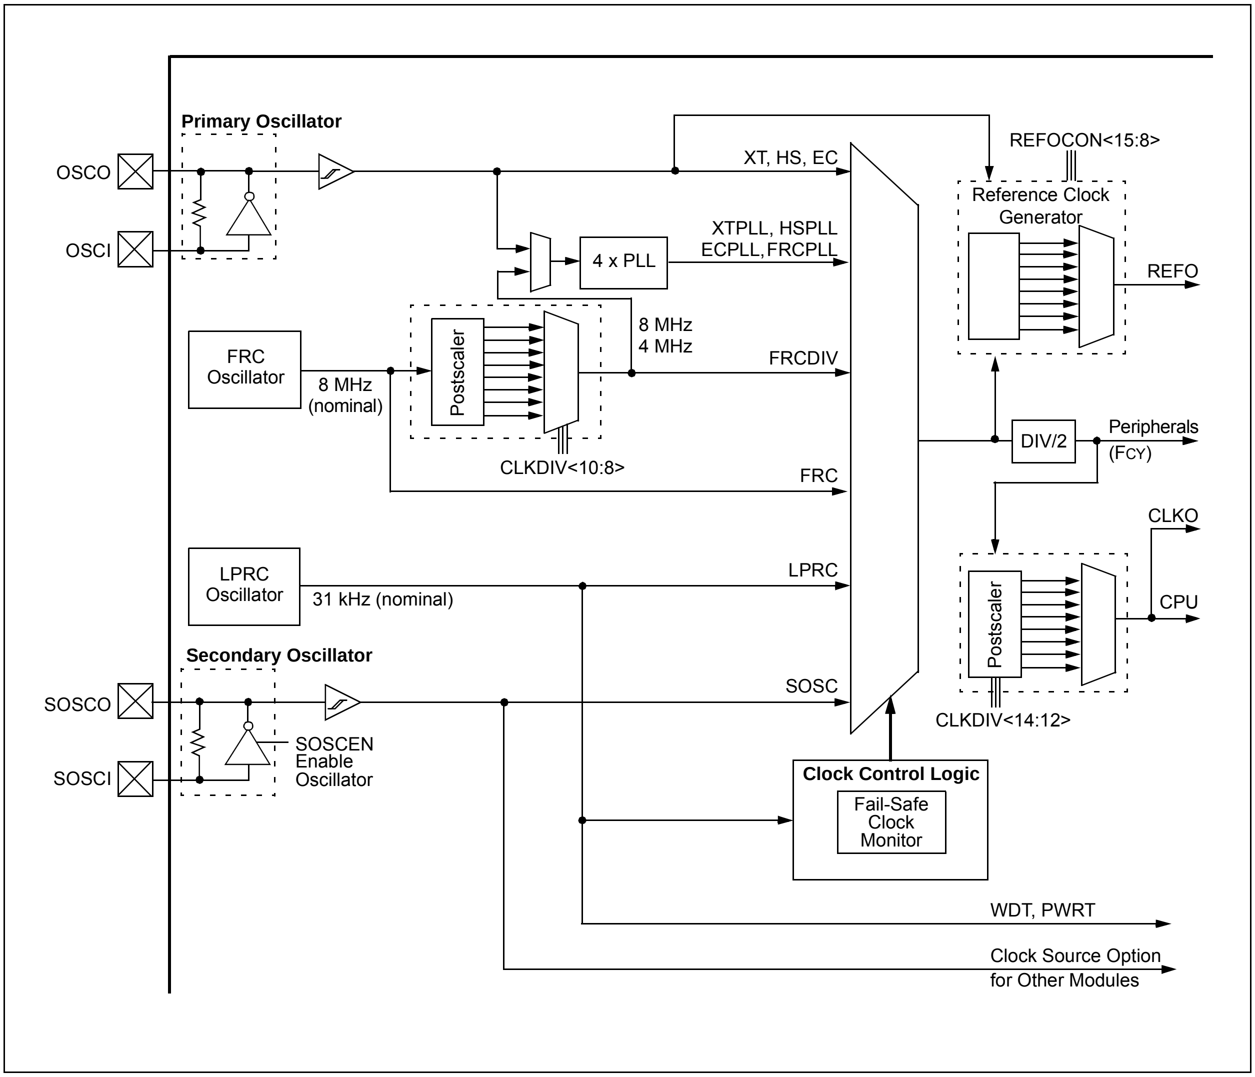
Note:	This data sheet summarizes the features of this group of PIC24F devices. It is not intended to be a comprehensive reference source. For more information, refer to the *“PIC24F Family Reference Manual”*, **Section 6. “Oscillator”** (DS39700).

The oscillator system for PIC24FJ256GA110 family devices has the following features:

- A total of four external and internal oscillator options as clock sources, providing 11 different clock modes
- On-chip 4x PLL to boost internal operating frequency on select internal and external oscillator sources
- Software-controllable switching between various clock sources
- Software-controllable postscaler for selective clocking of CPU for system power savings
- A Fail-Safe Clock Monitor (FSCM) that detects clock failure and permits safe application recovery or shutdown
- A separate and independently configurable system clock output for synchronizing external hardware

A simplified diagram of the oscillator system is shown in Figure 8-1.

FIGURE 8-1: PIC24FJ256GA110 FAMILY CLOCK DIAGRAM



10.1.1 OPEN-DRAIN CONFIGURATION

In addition to the PORT, LAT and TRIS registers for data control, each port pin can also be individually configured for either digital or open-drain output. This is controlled by the Open-Drain Control register, ODCx, associated with each port. Setting any of the bits configures the corresponding pin to act as an open-drain output.

The open-drain feature allows the generation of outputs higher than VDD (e.g., 5V) on any desired digital only pins by using external pull-up resistors. The maximum open-drain voltage allowed is the same as the maximum VIH specification.

10.2 Configuring Analog Port Pins

The AD1PCFGL and TRIS registers control the operation of the A/D port pins. Setting a port pin as an analog input also requires that the corresponding TRIS bit be set. If the TRIS bit is cleared (output), the digital output level (VOH or VOL) will be converted.

When reading the PORT register, all pins configured as analog input channels will read as cleared (a low level).

Pins configured as digital inputs will not convert an analog input. Analog levels on any pin that is defined as a digital input (including the ANx pins) may cause the input buffer to consume current that exceeds the device specifications.

10.2.1 I/O PORT WRITE/READ TIMING

One instruction cycle is required between a port direction change or port write operation and a read operation of the same port. Typically, this instruction would be a `NOP`.

10.2.2 ANALOG INPUT PINS AND VOLTAGE CONSIDERATIONS

The voltage tolerance of pins used as device inputs is dependent on the pin's input function. Pins that are used as digital only inputs are able to handle DC voltages up to 5.5V, a level typical for digital logic circuits. In contrast, pins that also have analog input functions of any kind can only tolerate voltages up to VDD. Voltage excursions beyond VDD on these pins are always to be avoided. Table 10-1 summarizes the input capabilities. Refer to **Section 28.1 "DC Characteristics"** for more details.

> **Note:** For easy identification, the pin diagrams at the beginning of this data sheet also indicate 5.5V tolerant pins with dark grey shading.

TABLE 10-1: INPUT VOLTAGE LEVELS(1)

Port or Pin	Tolerated Input	Description
PORTA<10:9>	VDD	Only VDD input levels tolerated.
PORTB<15:0>		
PORTC<15:12>		
PORTD<7:6>		
PORTF<0>		
PORTG<9:6>		
PORTA<15:14>, PORTA<7:0>	5.5V	Tolerates input levels above VDD, useful for most standard logic.
PORTC<4:1>		
PORTD<15:8>, PORTD<5:0>		
PORTE<9:0>		
PORTF<13:12>, PORTF<8:1>		
PORTG<15:12>, PORTG<3:0>		

Note 1: Not all port pins shown here are implemented on 64-pin and 80-pin devices. Refer to **Section 1.0 "Device Overview"** to confirm which ports are available in specific devices.

EXAMPLE 10-1: PORT WRITE/READ EXAMPLE

```
MOV   0xFF00, W0          ; Configure PORTB<15:8> as inputs
MOV   W0, TRISB           ; and PORTB<7:0> as outputs
NOP                       ; Delay 1 cycle
BTSS  PORTB, #13          ; Next Instruction
```

bit 7-6 **Unimplemented:** Read as ‘0’

bit 5-0 **RP14R<5:0>:** RP14 Output Pin Mapping bits
Peripheral output number n is assigned to pin, RP14 (see Table 10-3 for peripheral function numbers).

Note 1: Unimplemented in 64-pin devices; read as ‘0’.

EQUATION 14-2: CALCULATION FOR MAXIMUM PWM RESOLUTION[1]

$$\text{Maximum PWM Resolution (bits)} = \frac{\log_{10}\left(\frac{F_{CY}}{F_{PWM} \cdot (\text{Timer Prescale Value})}\right)}{\log_{10}(2)} \text{ bits}$$

Note 1: Based on $F_{CY} = F_{OSC}/2$, Doze mode and PLL are disabled.

EXAMPLE 14-1: PWM PERIOD AND DUTY CYCLE CALCULATIONS[1]

1. Find the Timer Period register value for a desired PWM frequency of 52.08 kHz, where F_{OSC} = 8 MHz with PLL (32 MHz device clock rate) and a Timer2 prescaler setting of 1:1.

$T_{CY} = 2 * T_{OSC}$ = 62.5 ns

PWM Period = 1/PWM Frequency = 1/52.08 kHz = 19.2 μs

PWM Period = (PR2 + 1) • T_{CY} • (Timer2 Prescale Value)

19.2 μs = (PR2 + 1) • 62.5 ns • 1

PR2 = 306

2. Find the maximum resolution of the duty cycle that can be used with a 52.08 kHz frequency and a 32 MHz device clock rate:

PWM Resolution = $\log_{10}(F_{CY}/F_{PWM})/\log_{10}2)$ bits

= $(\log_{10}(16\text{ MHz}/52.08\text{ kHz})/\log_{10}2)$ bits

= 8.3 bits

Note 1: Based on $T_{CY} = 2 * T_{OSC}$, Doze mode and PLL are disabled.

TABLE 14-1: EXAMPLE PWM FREQUENCIES AND RESOLUTIONS AT 4 MIPS (F_{CY} = 4 MHz)[1]

PWM Frequency	7.6 Hz	61 Hz	122 Hz	977 Hz	3.9 kHz	31.3 kHz	125 kHz
Timer Prescaler Ratio	8	1	1	1	1	1	1
Period Register Value	FFFFh	FFFFh	7FFFh	0FFFh	03FFh	007Fh	001Fh
Resolution (bits)	16	16	15	12	10	7	5

Note 1: Based on $F_{CY} = F_{OSC}/2$, Doze mode and PLL are disabled.

TABLE 14-2: EXAMPLE PWM FREQUENCIES AND RESOLUTIONS AT 16 MIPS (F_{CY} = 16 MHz)[1]

PWM Frequency	30.5 Hz	244 Hz	488 Hz	3.9 kHz	15.6 kHz	125 kHz	500 kHz
Timer Prescaler Ratio	8	1	1	1	1	1	1
Period Register Value	FFFFh	FFFFh	7FFFh	0FFFh	03FFh	007Fh	001Fh
Resolution (bits)	16	16	15	12	10	7	5

Note 1: Based on $F_{CY} = F_{OSC}/2$, Doze mode and PLL are disabled.

bit 1-0 **PTEN<1:0>:** PMALH/PMALL Strobe Enable bits
1 = PMA1 and PMA0 function as either PMA<1:0> or PMALH and PMALL
0 = PMA1 and PMA0 pads functions as port I/O

20.0 PROGRAMMABLE CYCLIC REDUNDANCY CHECK (CRC) GENERATOR

Note:	This data sheet summarizes the features of this group of PIC24F devices. It is not intended to be a comprehensive reference source. For more information, refer to the *"PIC24F Family Reference Manual"*, **Section 30. "Programmable Cyclic Redundancy Check (CRC)"** (DS39714).

The programmable CRC generator offers the following features:

- User-programmable polynomial CRC equation
- Interrupt output
- Data FIFO

The module implements a software configurable CRC generator. The terms of the polynomial and its length can be programmed using the X<15:1> bits (CRCXOR<15:1>) and the PLEN<3:0> bits (CRCCON<3:0>), respectively.

Consider the CRC equation:

$$x^{16} + x^{12} + x^5 + 1$$

To program this polynomial into the CRC generator, the CRC register bits should be set as shown in Table 20-1.

TABLE 20-1: EXAMPLE CRC SETUP

Bit Name	Bit Value
PLEN<3:0>	1111
X<15:1>	000100000010000

Note that for the value of X<15:1>, the 12th bit and the 5th bit are set to '1', as required by the equation. The 0 bit required by the equation is always XORed. For a 16-bit polynomial, the 16th bit is also always assumed to be XORed; therefore, the X<15:1> bits do not have the 0 bit or the 16th bit.

A simplified block diagram of the module is shown in Figure 20-1. The general topology of the shift engine is shown in Figure 20-2.

FIGURE 20-1: CRC BLOCK DIAGRAM

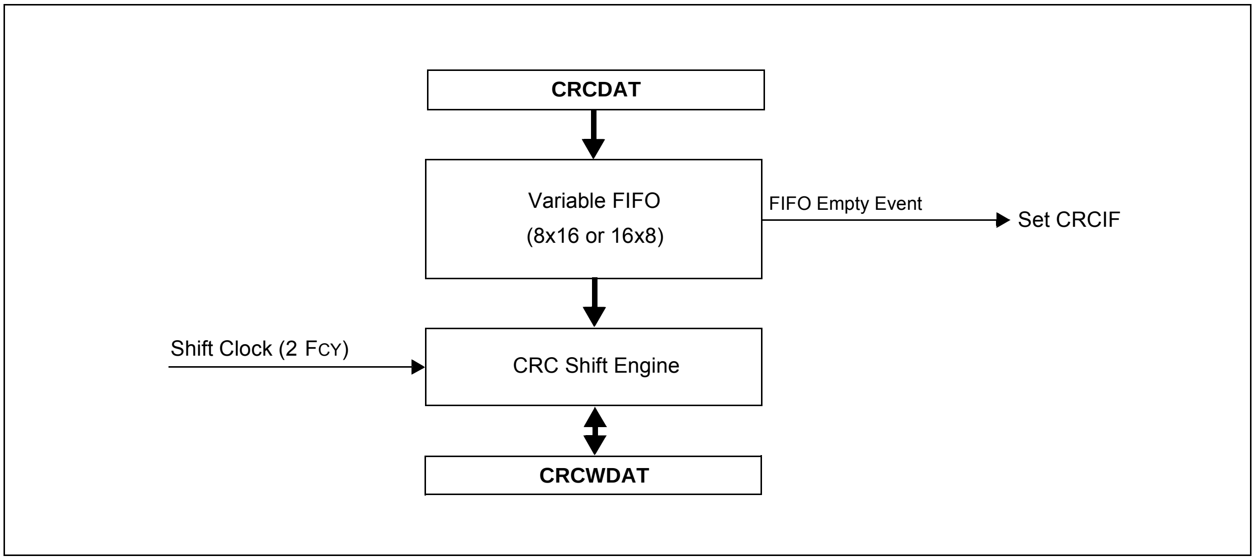

FIGURE 21-3: A/D TRANSFER FUNCTION

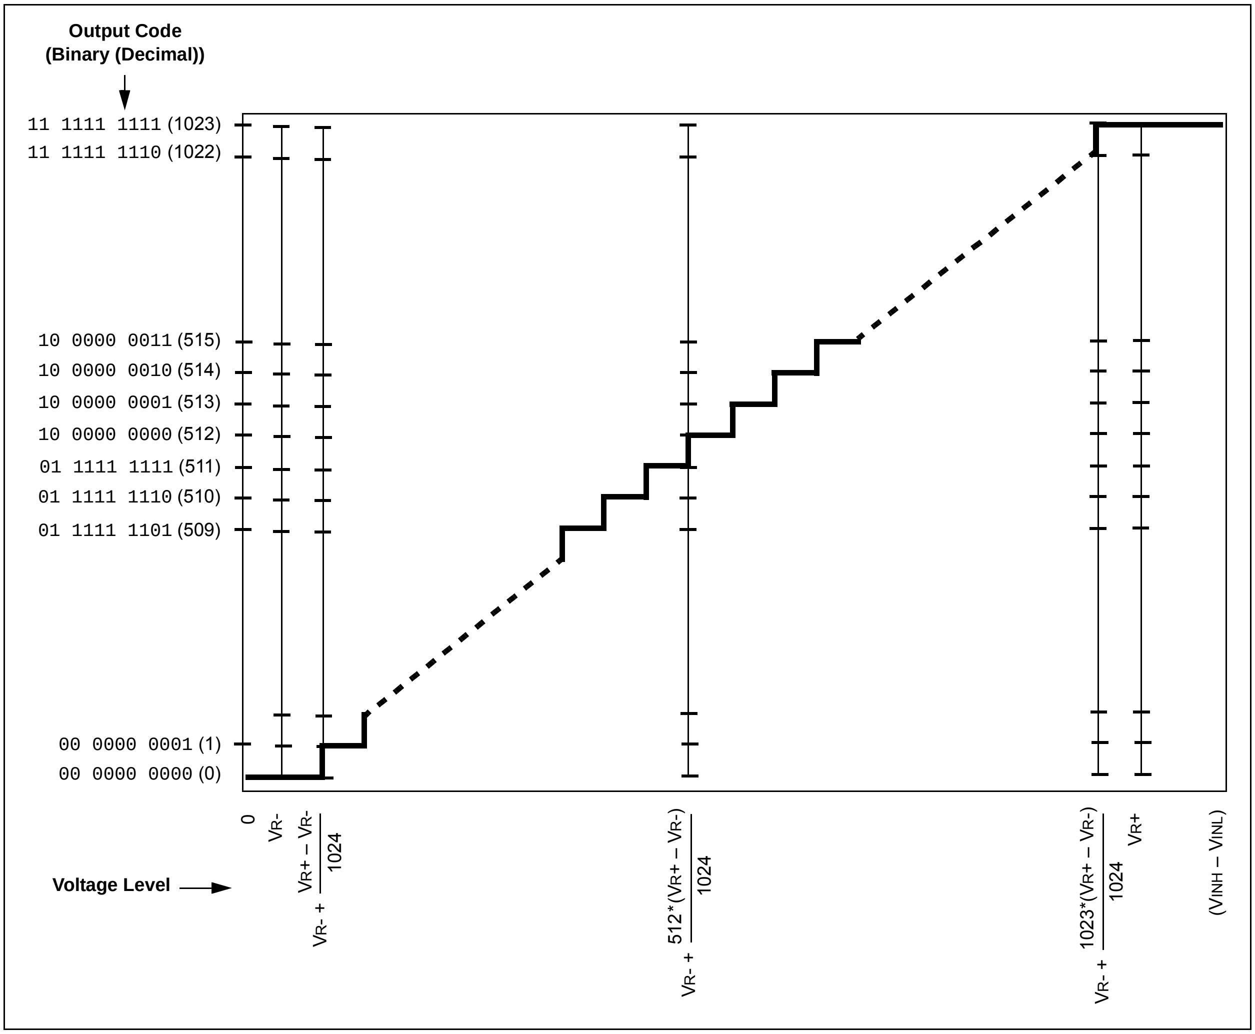

26.0 INSTRUCTION SET SUMMARY

Note:	This chapter is a brief summary of the PIC24F instruction set architecture, and is not intended to be a comprehensive reference source.

The PIC24F instruction set adds many enhancements to the previous PIC® MCU instruction sets, while maintaining an easy migration from previous PIC MCU instruction sets. Most instructions are a single program memory word. Only three instructions require two program memory locations.

Each single-word instruction is a 24-bit word divided into an 8-bit opcode, which specifies the instruction type and one or more operands, which further specify the operation of the instruction. The instruction set is highly orthogonal and is grouped into four basic categories:

- Word or byte-oriented operations
- Bit-oriented operations
- Literal operations
- Control operations

Table 26-1 shows the general symbols used in describing the instructions. The PIC24F instruction set summary in Table 26-2 lists all of the instructions, along with the status flags affected by each instruction.

Most word or byte-oriented W register instructions (including barrel shift instructions) have three operands:

- The first source operand, which is typically a register, ‘Wb’, without any address modifier
- The second source operand, which is typically a register, ‘Ws’, with or without an address modifier
- The destination of the result, which is typically a registe,r ‘Wd’, with or without an address modifier

However, word or byte-oriented file register instructions have two operands:

- The file register specified by the value, ‘f’
- The destination, which could either be the file register, ‘f’, or the W0 register, which is denoted as ‘WREG’

Most bit-oriented instructions (including simple rotate/shift instructions) have two operands:

- The W register (with or without an address modifier) or file register (specified by the value of ‘Ws’ or ‘f’)
- The bit in the W register or file register (specified by a literal value or indirectly by the contents of register, ‘Wb’)

The literal instructions that involve data movement may use some of the following operands:

- A literal value to be loaded into a W register or file register (specified by the value of ‘k’)
- The W register or file register where the literal value is to be loaded (specified by ‘Wb’ or ‘f’)

However, literal instructions that involve arithmetic or logical operations use some of the following operands:

- The first source operand, which is a register, ‘Wb’, without any address modifier
- The second source operand, which is a literal value
- The destination of the result (only if not the same as the first source operand), which is typically a register ‘Wd’ with or without an address modifier

The control instructions may use some of the following operands:

- A program memory address
- The mode of the table read and table write instructions

All instructions are a single word, except for certain double-word instructions, which were made double-word instructions so that all the required information is available in these 48 bits. In the second word, the 8 MSbs are ‘0’s. If this second word is executed as an instruction (by itself), it will execute as a NOP.

Most single-word instructions are executed in a single instruction cycle, unless a conditional test is true or the program counter is changed as a result of the instruction. In these cases, the execution takes two instruction cycles, with the additional instruction cycle(s) executed as a NOP. Notable exceptions are the BRA (unconditional/computed branch), indirect CALL/GOTO, all table reads and writes, and RETURN/RETFIE instructions, which are single-word instructions but take two or three cycles.

Certain instructions that involve skipping over the subsequent instruction require either two or three cycles if the skip is performed, depending on whether the instruction being skipped is a single-word or two-word instruction. Moreover, double-word moves require two cycles. The double-word instructions execute in two instruction cycles.

TABLE 28-14: PLL CLOCK TIMING SPECIFICATIONS (V_{DD} = 2.0V TO 3.6V)

AC CHARACTERISTICS			Standard Operating Conditions: 2.0V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ T_A ≤ +85°C for Industrial -40°C ≤ T_A ≤ +125°C for Extended				
Param No.	**Sym**	**Characteristic(1)**	**Min**	**Typ(2)**	**Max**	**Units**	**Conditions**
OS50	F_{PLLI}	PLL Input Frequency Range(2)	4	—	8	MHz	ECPLL, HSPLL, XTPLL modes
OS51	F_{SYS}	PLL Output Frequency Range	16	—	32	MHz	
OS52	T_{LOCK}	PLL Start-up Time (Lock Time)	—	—	2	ms	
OS53	D_{CLK}	CLKO Stability (Jitter)	-2	1	+2	%	

Note 1: These parameters are characterized but not tested in manufacturing.

2: Data in “Typ” column is at 3.3V, 25°C unless otherwise stated. Parameters are for design guidance only and are not tested.

TABLE 28-15: INTERNAL RC OSCILLATOR SPECIFICATIONS

AC CHARACTERISTICS			Standard Operating Conditions: 2.0V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ T_A ≤ +85°C for Industrial -40°C ≤ T_A ≤ +125°C for Extended				
Param No.	**Sym**	**Characteristic**	**Min**	**Typ**	**Max**	**Units**	**Conditions**
	T_{FRC}	FRC Start-up Time	—	15	—	μs	
	T_{LPRC}	LPRC Start-up Time	—	40	—	μs	

TABLE 28-16: INTERNAL RC OSCILLATOR ACCURACY

AC CHARACTERISTICS		Standard Operating Conditions: 2.0V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ T_A ≤ +85°C for Industrial -40°C ≤ T_A ≤ +125°C for Extended				
Param No.	**Characteristic**	**Min**	**Typ**	**Max**	**Units**	**Conditions**
F20	FRC Accuracy @ 8 MHz(1)	-2	—	2	%	+25°C, 3.0V ≤ V_{DD} ≤ 3.6V
		-5	—	5	%	-40°C ≤ T_A ≤ +85°C, 3.0V ≤ V_{DD} ≤ 3.6V
F21	LPRC Accuracy @ 31 kHz(2)	-20	—	20	%	-40°C ≤ T_A ≤ +85°C, 3.0V ≤ V_{DD} ≤ 3.6V

Note 1: Frequency calibrated at 25°C and 3.3V. OSCTUN bits can be used to compensate for temperature drift.

2: Change of LPRC frequency as V_{DD} changes.

TABLE 28-20: ADC CONVERSION TIMING REQUIREMENTS[1]

AC CHARACTERISTICS			Standard Operating Conditions: 2.0V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial -40°C ≤ TA ≤ +125°C for Extended				
Param No.	**Symbol**	**Characteristic**	**Min.**	**Typ**	**Max.**	**Units**	**Conditions**
Clock Parameters							
AD50	TAD	ADC Clock Period	75	—	—	ns	TCY = 75 ns, AD1CON3 in default state
AD51	tRC	ADC Internal RC Oscillator Period	—	250	—	ns	
Conversion Rate							
AD55	tCONV	Conversion Time	—	12	—	TAD	
AD56	FCNV	Throughput Rate	—	—	500	ksps	AVDD > 2.7V
AD57	tSAMP	Sample Time	—	1	—	TAD	
Clock Parameters							
AD61	tPSS	Sample Start Delay from Setting Sample bit (SAMP)	2	—	3	TAD	
AD132	TACQ	Acquisition Time	—	—	750	ns	**(Note 2)**
AD135	TSWC	Switching Time from Convert to Sample	—	—	**(Note 3)**		
AD137	TDIS	Discharge Time	0.5	—	—	TAD	
		A/D Stabilization Time (from setting ADON to setting SAMP)	—	300	—	ns	

Note 1: Because the sample caps will eventually lose charge, clock rates below 10 kHz can affect linearity performance, especially at elevated temperatures.

FIGURE 28-11: SPIx MODULE MASTER MODE TIMING CHARACTERISTICS (CKE = 0)

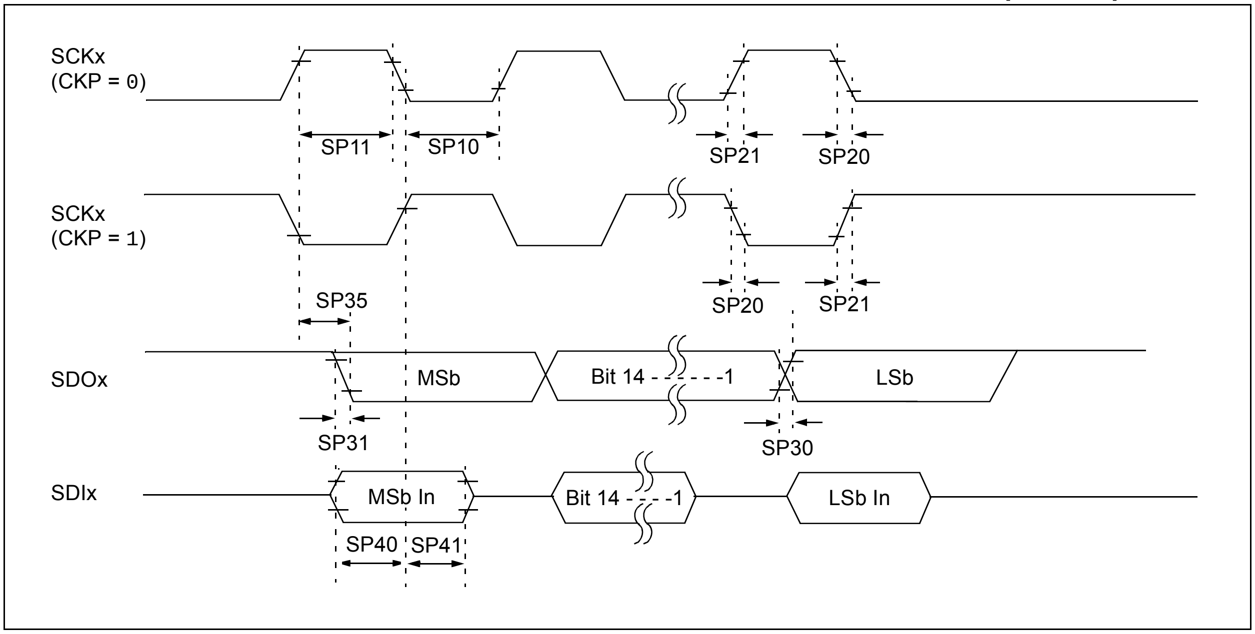

TABLE 28-24: SPIx MASTER MODE TIMING REQUIREMENTS (CKE = 0)

AC CHARACTERISTICS			Standard Operating Conditions: 2.0V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial				
Param No.	**Symbol**	**Characteristic**	**Min**	**Typ(1)**	**Max**	**Units**	**Conditions**
SP10	TscL	SCKx Output Low Time(2)	TCY/2	—	—	ns	
SP11	TscH	SCKx Output High Time(2)	TCY/2	—	—	ns	
SP20	TscF	SCKx Output Fall Time(3)	—	10	25	ns	
SP21	TscR	SCKx Output Rise Time(3)	—	10	25	ns	
SP30	TdoF	SDOx Data Output Fall Time(3)	—	10	25	ns	
SP31	TdoR	SDOx Data Output Rise Time(3)	—	10	25	ns	
SP35	TscH2doV, TscL2doV	SDOx Data Output Valid after SCKx Edge	—	—	30	ns	
SP40	TdiV2scH, TdiV2scL	Setup Time of SDIx Data Input to SCKx Edge	20	—	—	ns	
SP41	TscH2diL, TscL2diL	Hold Time of SDIx Data Input to SCKx Edge	20	—	—	ns	

Note 1: Data in “Typ” column is at 3.3V, 25°C unless otherwise stated. Parameters are for design guidance only and are not tested.

2: The minimum clock period for SCKx is 100 ns; therefore, the clock generated in Master mode must not violate this specification.

3: Assumes 50 pF load on all SPIx pins.

FIGURE 28-21: PARALLEL SLAVE PORT TIMING

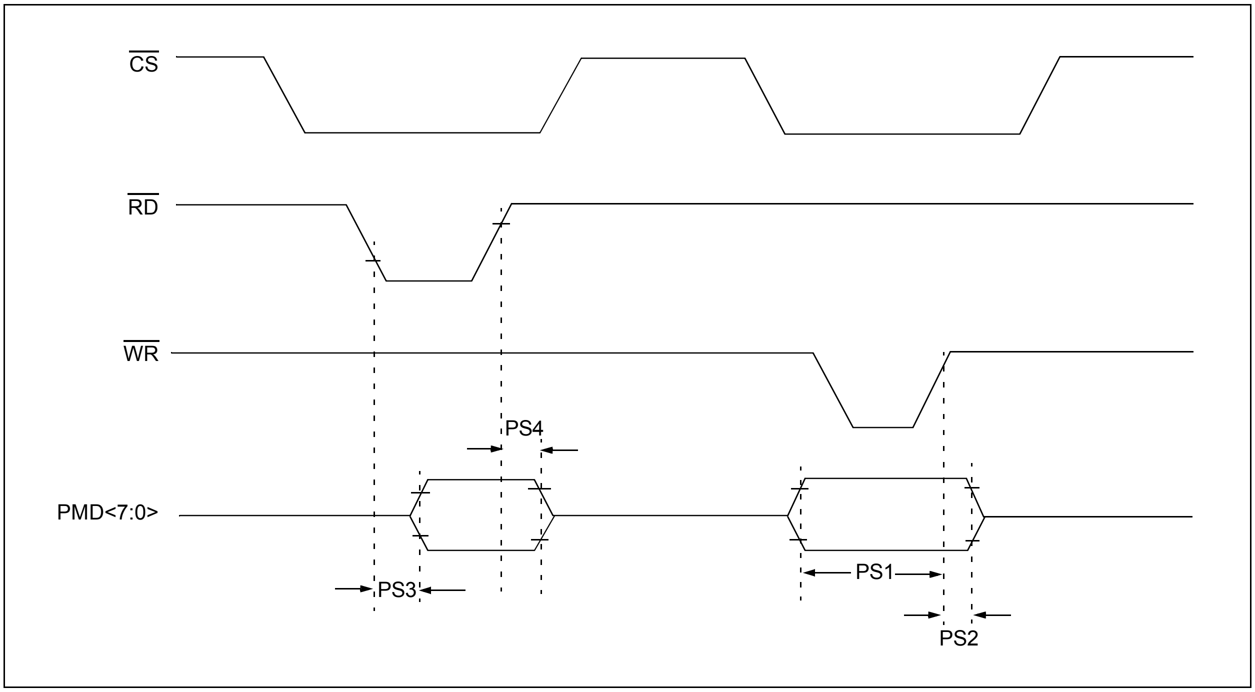

TABLE 28-34: PARALLEL SLAVE PORT REQUIREMENTS

AC CHARACTERISTICS			Standard Operating Conditions: 2.0V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial				
Param. No.	Symbol	Characteristic	Min	Typ	Max	Units	Conditions
PS1	TdtV2wrH	Data In Valid before $\overline{\text{WR}}$ or $\overline{\text{CS}}$ Inactive (setup time)	20	—	—	ns	
PS2	TwrH2dtI	$\overline{\text{WR}}$ or $\overline{\text{CS}}$ Inactive to Data–In Invalid (hold time)	20	—	—	ns	
PS3	TrdL2dtV	$\overline{\text{RD}}$ and $\overline{\text{CS}}$ Active to Data–Out Valid	—	—	80	ns	
PS4	TrdH2dtI	$\overline{\text{RD}}$ Active or $\overline{\text{CS}}$ Inactive to Data–Out Invalid	10	—	30	ns
