
Welcome to E-XFL.COM

What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Active
Core Processor	PIC
Core Size	16-Bit
Speed	32MHz
Connectivity	I²C, PMP, SPI, UART/USART
Peripherals	Brown-out Detect/Reset, LVD, POR, PWM, WDT
Number of I/O	53
Program Memory Size	256KB (85.5K x 24)
Program Memory Type	FLASH
EEPROM Size	-
RAM Size	16K x 8
Voltage - Supply (Vcc/Vdd)	2V ~ 3.6V
Data Converters	A/D 16x10b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 85°C (TA)
Mounting Type	Surface Mount
Package / Case	64-TQFP
Supplier Device Package	64-TQFP (10x10)
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/pic24fj256ga106-i-pt

TABLE 1-3: DEVICE FEATURES FOR THE PIC24FJ256GA110 FAMILY: 100-PIN DEVICES

Features	PIC24FJ64GA110	PIC24FJ128GA110	PIC24FJ192GA110	PIC24FJ256GA110
Operating Frequency	DC – 32 MHz			
Program Memory (bytes)	64K	128K	192K	256K
Program Memory (instructions)	22,016	44,032	67,072	87,552
Data Memory (bytes)	16,384			
Interrupt Sources (soft vectors/NMI traps)	66 (62/4)			
I/O Ports	Ports A, B, C, D, E, F, G			
Total I/O Pins	85			
Remappable Pins	46 (32 I/O, 14 input only)			
Timers:				
Total Number (16-bit)	5(1)			
32-Bit (from paired 16-bit timers)	2			
Input Capture Channels	9(1)			
Output Compare/PWM Channels	9(1)			
Input Change Notification Interrupt	85			
Serial Communications:				
UART	4(1)			
SPI (3-wire/4-wire)	3(1)			
I^2C™	3			
Parallel Communications (PMP/PSP)	Yes			
JTAG Boundary Scan	Yes			
10-Bit Analog-to-Digital Module (input channels)	16			
Analog Comparators	3			
CTMU Interface	Yes			
Resets (and delays)	POR, BOR, RESET Instruction, $\overline{\text{MCLR}}$, WDT; Illegal Opcode, REPEAT Instruction, Hardware Traps, Configuration Word Mismatch (PWRT, OST, PLL Lock)			
Instruction Set	76 Base Instructions, Multiple Addressing Mode Variations			
Packages	100-Pin TQFP			

Note 1: Peripherals are accessible through remappable pins.

TABLE 4-5: INTERRUPT CONTROLLER REGISTER MAP

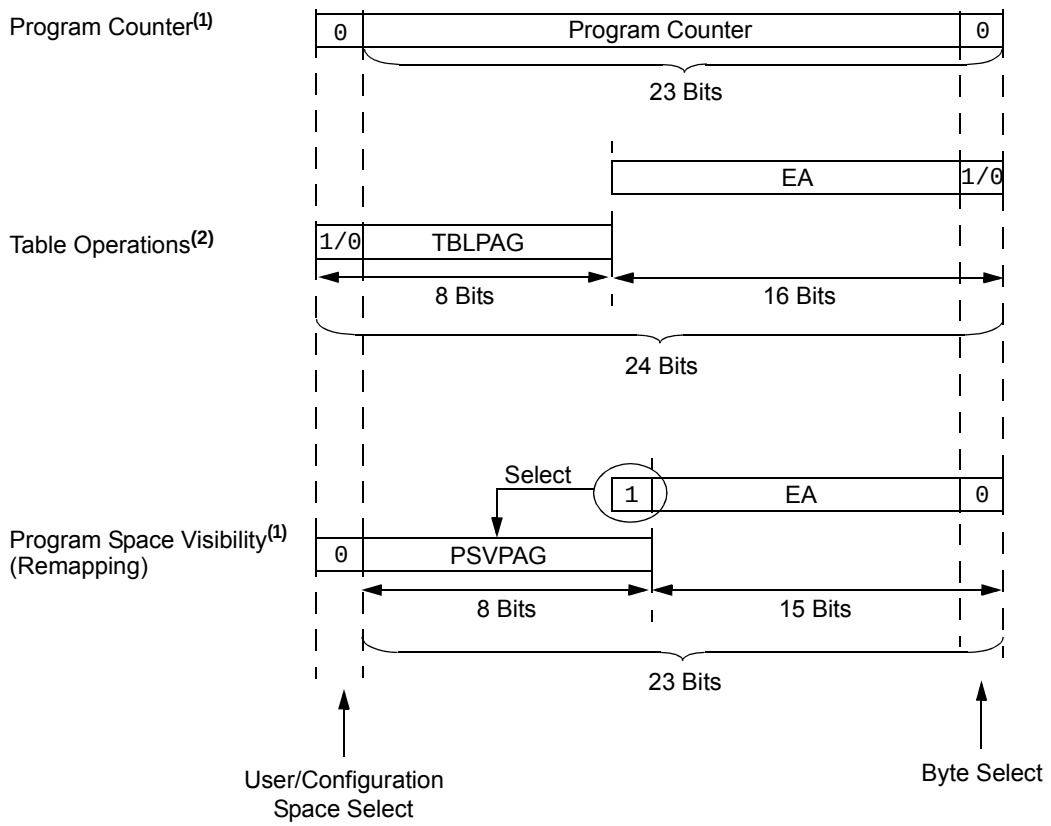
TABLE 4-30: PROGRAM SPACE ADDRESS CONSTRUCTION

Access Type	Access Space	Program Space Address				
		<23>	<22:16>	<15>	<14:1>	<0>
Instruction Access (Code Execution)	User	0	PC<22:1>			0
		0xx xxxx xxxx xxxx xxxx xxx0				
TBLRD/TBLWT (Byte/Word Read/Write)	User	TBLPAG<7:0>		Data EA<15:0>		
		0xxx xxxx		xxxx xxxx xxxx xxxx		
	Configuration	TBLPAG<7:0>		Data EA<15:0>		
		1xxx xxxx		xxxx xxxx xxxx xxxx		
Program Space Visibility (Block Remap/Read)	User	0	PSVPAG<7:0>		Data EA<14:0>(1)	
		0	xxxx xxxx		xxx xxxx xxxx xxxx	

Note 1: Data EA<15> is always '1' in this case, but is not used in calculating the program space address. Bit 15 of the address is PSVPAG<0>.

FIGURE 4-5: DATA ACCESS FROM PROGRAM SPACE ADDRESS GENERATION



Note 1: The LSb of program space addresses is always fixed as '0' in order to maintain word alignment of data in the program and data spaces.

2: Table operations are not required to be word-aligned. Table read operations are permitted in the configuration memory space.

EXAMPLE 5-2: ERASING A PROGRAM MEMORY BLOCK (C LANGUAGE CODE)

```
// C example using MPLAB C30
    unsigned long progAddr = 0xXXXXXX;       // Address of row to write
    unsigned int offset;

//Set up pointer to the first memory location to be written
    TBLPAG = progAddr>>16;                   // Initialize PM Page Boundary SFR
    offset = progAddr & 0xFFFF;              // Initialize lower word of address

    __builtin_tblwtl(offset, 0x0000);        // Set base address of erase block
                                             // with dummy latch write

    NVMCON = 0x4042;                         // Initialize NVMCON

    asm("DISI #5");                          // Block all interrupts with priority <7
                                             // for next 5 instructions
    __builtin_write_NVM();                   // C30 function to perform unlock
                                             // sequence and set WR
```

EXAMPLE 5-3: LOADING THE WRITE BUFFERS (ASSEMBLY LANGUAGE CODE)

```
; Set up NVMCON for row programming operations
       MOV     #0x4001, W0                   ;
       MOV     W0, NVMCON                    ; Initialize NVMCON
; Set up a pointer to the first program memory location to be written
; program memory selected, and writes enabled
       MOV     #0x0000, W0                   ;
       MOV     W0, TBLPAG                    ; Initialize PM Page Boundary SFR
       MOV     #0x6000, W0                   ; An example program memory address
; Perform the TBLWT instructions to write the latches
; 0th_program_word
       MOV     #LOW_WORD_0, W2               ;
       MOV     #HIGH_BYTE_0, W3              ;
       TBLWTL  W2, [W0]                      ; Write PM low word into program latch
       TBLWTH  W3, [W0++]                    ; Write PM high byte into program latch
; 1st_program_word
       MOV     #LOW_WORD_1, W2               ;
       MOV     #HIGH_BYTE_1, W3              ;
       TBLWTL  W2, [W0]                      ; Write PM low word into program latch
       TBLWTH  W3, [W0++]                    ; Write PM high byte into program latch
;  2nd_program_word
       MOV     #LOW_WORD_2, W2               ;
       MOV     #HIGH_BYTE_2, W3              ;
       TBLWTL  W2, [W0]                      ; Write PM low word into program latch
       TBLWTH  W3, [W0++]                    ; Write PM high byte into program latch
       •
       •
       •
; 63rd_program_word
       MOV     #LOW_WORD_31, W2              ;
       MOV     #HIGH_BYTE_31, W3             ;
       TBLWTL  W2, [W0]                      ; Write PM low word into program latch
       TBLWTH  W3, [W0]                      ; Write PM high byte into program latch
```

U-0	U-0	U-0	U-0	U-0	U-0	U-0	U-0
—	—	—	—	—	—	—	—
bit 15							bit 8

U-0	U-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0
—	—	TUN5(1)	TUN4(1)	TUN3(1)	TUN2(1)	TUN1(1)	TUN0(1)
bit 7							bit 0

Legend:			
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 15-6 **Unimplemented:** Read as '0'

bit 5-0 **TUN<5:0>:** FRC Oscillator Tuning bits(1)

011111 = Maximum frequency deviation
011110 =
•
•
•
000001 =
000000 = Center frequency, oscillator is running at factory calibrated frequency
111111 =
•
•
•
100001 =
100000 = Minimum frequency deviation

Note 1: Increments or decrements of TUN<5:0> may not change the FRC frequency in equal steps over the FRC tuning range and may not be monotonic.

8.4 Clock Switching Operation

With few limitations, applications are free to switch between any of the four clock sources (POSC, SOSC, FRC and LPRC) under software control and at any time. To limit the possible side effects that could result from this flexibility, PIC24F devices have a safeguard lock built into the switching process.

Note: The Primary Oscillator mode has three different submodes (XT, HS and EC) which are determined by the POSCMDx Configuration bits. While an application can switch to and from Primary Oscillator mode in software, it cannot switch between the different primary submodes without reprogramming the device.

8.4.1 ENABLING CLOCK SWITCHING

To enable clock switching, the FCKSM1 Configuration bit in CW 2 must be programmed to '0'. (Refer to **Section 25.1 "Configuration Bits"** for further details.) If the FCKSM1 Configuration bit is unprogrammed ('1'), the clock switching function and Fail-Safe Clock Monitor function are disabled; this is the default setting.

The NOSCx control bits (OSCCON<10:8>) do not control the clock selection when clock switching is disabled. However, the COSCx bits (OSCCON<14:12>) will reflect the clock source selected by the FNOSCx Configuration bits.

The OSWEN control bit (OSCCON<0>) has no effect when clock switching is disabled; it is held at '0' at all times.

10.4.2 AVAILABLE PERIPHERALS

The peripherals managed by the Peripheral Pin Select are all digital only peripherals. These include general serial communications (UART and SPI), general purpose timer clock inputs, timer related peripherals (input capture and output compare) and external interrupt inputs. Also included are the outputs of the comparator module, since these are discrete digital signals.

Peripheral Pin Select is not available for I^2C™, change notification inputs, RTCC alarm outputs or peripherals with analog inputs.

A key difference between pin select and non pin select peripherals is that pin select peripherals are not associated with a default I/O pin. The peripheral must always be assigned to a specific I/O pin before it can be used. In contrast, non pin select peripherals are always available on a default pin, assuming that the peripheral is active and not conflicting with another peripheral.

10.4.2.1 Peripheral Pin Select Function Priority

Pin-selectable peripheral outputs (e.g. OC, UART Transmit) take priority over general purpose digital functions on a pin, such as PMP and port I/O. Specialized digital outputs, such as USB functionality, will take priority over PPS outputs on the same pin. The pin diagrams provided at the beginning of this data sheet list peripheral outputs in order of priority. Refer to them for priority concerns on a particular pin.

Unlike PIC24F devices with fixed peripherals, pin-selectable peripheral inputs never take ownership of a pin. The pin's output buffer is controlled by the TRISx setting or by a fixed peripheral on the pin. If the pin is configured in Digital mode, the PPS input will operate correctly. If an analog function is enabled on the pin, the PPS input will be disabled.

10.4.3 CONTROLLING PERIPHERAL PIN SELECT

Peripheral Pin Select features are controlled through two sets of Special Function Registers: one to map peripheral inputs and one to map outputs. Because they are separately controlled, a particular peripheral's input and output (if the peripheral has both) can be placed on any selectable function pin without constraint.

The association of a peripheral to a peripheral-selectable pin is handled in two different ways, depending on if an input or an output is being mapped.

10.4.3.1 Input Mapping

The inputs of the Peripheral Pin Select options are mapped on the basis of the peripheral; that is, a control register associated with a peripheral dictates the pin it will be mapped to. The RPINRx registers are used to configure peripheral input mapping (see Register 10-1 through Register 10-21). Each register contains two sets of 6-bit fields, with each set associated with one of the pin-selectable peripherals. Programming a given peripheral's bit field with an appropriate 6-bit value maps the RPn pin with that value to that peripheral. For any given device, the valid range of values for any of the bit fields corresponds to the maximum number of Peripheral Pin Select options supported by the device.

10.4.3.2 Output Mapping

In contrast to inputs, the outputs of the Peripheral Pin Select options are mapped on the basis of the pin. In this case, a control register associated with a particular pin dictates the peripheral output to be mapped. The RPORx registers are used to control output mapping. Each register contains two 6-bit fields, with each field being associated with one RPn pin (see Register 10-22 through Register 10-37). The value of the bit field corresponds to one of the peripherals and that peripheral's output is mapped to the pin (see Table 10-3).

Because of the mapping technique, the list of peripherals for output mapping also includes a null value of '000000'. This permits any given pin to remain disconnected from the output of any of the pin-selectable peripherals.

10.4.3.3 Alternate Fixed Pin Mapping

To provide a migration option from earlier high pin count PIC24F devices, PIC24FJ256GA110 family devices implement an additional option for mapping the clock output (SCK) of SPI1. This option permits users to map SCK1OUT specifically to the fixed pin function, ASCK1. The SCK1CM bit (ALTRP<0>) controls this mapping; setting the bit maps SCK1OUT to ASCK1.

The SCK1CM bit must be set (= 1) before enabling the SPI module. It must remain set while transactions using SPI1 are in progress, in order to prevent transmission errors; when the module is disabled, the bit must be cleared. Additionally, no other RPOUT register should be configured to output the SCK1OUT function while SCK1CM is set.

10.4.3.4 Mapping Limitations

The control schema of the Peripheral Pin Select is extremely flexible. Other than systematic blocks that prevent signal contention caused by two physical pins being configured as the same functional input or two functional outputs configured as the same pin, there are no hardware enforced lock outs. The flexibility extends to the point of allowing a single input to drive multiple peripherals or a single functional output to drive multiple output pins.

10.4.3.5 Mapping Exceptions for PIC24FJ256GA110 Family Devices

Although the PPS registers theoretically allow for up to 64 remappable I/O pins, not all of these are implemented in all devices. For PIC24FJ256GA110 family devices, the maximum number of remappable pins available are 46, which includes 14 input only pins. In addition, some pins in the RPn and RPIn sequences are unimplemented in lower pin count devices. The differences in available remappable pins are summarized in Table 10-4.

When developing applications that use remappable pins, users should also keep these things in mind:

- For the RPINRx registers, bit combinations corresponding to an unimplemented pin for a particular device are treated as invalid; the corresponding module will not have an input mapped to it. For all PIC24FJ256GA110 family devices, this includes all values greater than 45 (‘101101’).
- For RPORx registers, the bit fields corresponding to an unimplemented pin will also be unimplemented. Writing to these fields will have no effect.

10.4.4 CONTROLLING CONFIGURATION CHANGES

Because peripheral remapping can be changed during run time, some restrictions on peripheral remapping are needed to prevent accidental configuration changes. PIC24F devices include three features to prevent alterations to the peripheral map:

- Control register lock sequence
- Continuous state monitoring
- Configuration bit remapping lock

10.4.4.1 Control Register Lock

Under normal operation, writes to the RPINRx and RPORx registers are not allowed. Attempted writes will appear to execute normally, but the contents of the registers will remain unchanged. To change these registers, they must be unlocked in hardware. The register lock is controlled by the IOLOCK bit (OSCCON<6>). Setting IOLOCK prevents writes to the control registers; clearing IOLOCK allows writes.

To set or clear IOLOCK, a specific command sequence must be executed:

1. Write 46h to OSCCON<7:0>.
2. Write 57h to OSCCON<7:0>.
3. Clear (or set) IOLOCK as a single operation.

Unlike the similar sequence with the oscillator’s LOCK bit, IOLOCK remains in one state until changed. This allows all of the Peripheral Pin Selects to be configured with a single unlock sequence, followed by an update to all control registers, then locked with a second lock sequence.

10.4.4.2 Continuous State Monitoring

In addition to being protected from direct writes, the contents of the RPINRx and RPORx registers are constantly monitored in hardware by shadow registers. If an unexpected change in any of the registers occurs (such as cell disturbances caused by ESD or other external events), a Configuration Mismatch Reset will be triggered.

10.4.4.3 Configuration Bit Pin Select Lock

As an additional level of safety, the device can be configured to prevent more than one write session to the RPINRx and RPORx registers. The IOL1WAY (CW2<4>) Configuration bit blocks the IOLOCK bit from being cleared after it has been set once. If IOLOCK remains set, the register unlock procedure will not execute and the Peripheral Pin Select Control registers cannot be written to. The only way to clear the bit and re-enable peripheral remapping is to perform a device Reset.

In the default (unprogrammed) state, IOL1WAY is set, restricting users to one write session. Programming IOL1WAY allows users unlimited access (with the proper use of the unlock sequence) to the Peripheral Pin Select registers.

TABLE 10-4: REMAPPABLE PIN EXCEPTIONS FOR PIC24FJ256GA110 FAMILY DEVICES

Device Pin Count	RP Pins (I/O)		RPI Pins	
	Total	Unimplemented	Total	Unimplemented
64-pin	29	RP5, RP15, RP31	2	RPI32-36, RPI38-44

R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 15 **TON:** Timery On bit(1)
1 = Starts 16-bit Timery
0 = Stops 16-bit Timery

bit 14 **Unimplemented:** Read as '0'

bit 13 **TSIDL:** Stop in Idle Mode bit(1)
1 = Discontinue module operation when device enters Idle mode
0 = Continue module operation in Idle mode

bit 12-7 **Unimplemented:** Read as '0'

bit 6 **TGATE:** Timery Gated Time Accumulation Enable bit(1)
When TCS = 1:
This bit is ignored.
When TCS = 0:
1 = Gated time accumulation enabled
0 = Gated time accumulation disabled

bit 5-4 **TCKPS<1:0>:** Timery Input Clock Prescale Select bits(1)
11 = 1:256
10 = 1:64
01 = 1:8
00 = 1:1

bit 3-2 **Unimplemented:** Read as '0'

bit 1 **TCS:** Timery Clock Source Select bit(1,2)
1 = External clock from pin TyCK (on the rising edge)
0 = Internal clock (FOSC/2)

bit 0 **Unimplemented:** Read as '0'

Note 1: When 32-bit operation is enabled (T2CON<3> or T4CON<3> = 1), these bits have no effect on Timery operation; all timer functions are set through T2CON and T4CON.

2: If TCS = 1, RPINRx (TyCK) must be configured to an available RPn pin. See **Section 10.4 "Peripheral Pin Select"** for more information.

3: Changing the value of TyCON while the timer is running (TON = 1) causes the timer prescale counter to reset and is not recommended.

14.0 OUTPUT COMPARE WITH DEDICATED TIMER

Note: This data sheet summarizes the features of this group of PIC24F devices. It is not intended to be a comprehensive reference source. For more information, refer to the *"PIC24F Family Reference Manual"*, **Section 35. "Output Compare with Dedicated Timer"** (DS39723)

Devices in the PIC24FJ256GA110 family all feature 9 independent enhanced output compare modules. Each of these modules offers a wide range of configuration and operating options for generating pulse trains on internal device events, and can produce Pulse-Width Modulated (PWM) waveforms for driving power applications.

Key features of the enhanced output compare module include:

- Hardware-configurable for 32-bit operation in all modes by cascading two adjacent modules
- Synchronous and Trigger modes of output compare operation, with up to 30 user-selectable trigger/sync sources available
- Two separate Period registers (a main register, OCxR, and a secondary register, OCxRS) for greater flexibility in generating pulses of varying widths
- Configurable for single pulse or continuous pulse generation on an output event, or continuous PWM waveform generation
- Up to 6 clock sources available for each module, driving a separate internal 16-bit counter

14.1 General Operating Modes

14.1.1 SYNCHRONOUS AND TRIGGER MODES

By default, the enhanced output compare module operates in a free-running mode. The internal, 16-bit counter, OCxTMR, counts up continuously, wrapping around from FFFFh to 0000h on each overflow, with its period synchronized to the selected external clock source. Compare or PWM events are generated each time a match between the internal counter and one of the Period registers occurs.

In Synchronous mode, the module begins performing its compare or PWM operation as soon as its selected clock source is enabled. Whenever an event occurs on the selected sync source, the module's internal counter is reset. In Trigger mode, the module waits for a sync event from another internal module to occur before allowing the counter to run.

Free-running mode is selected by default, or any time that the SYNCSEL bits (OCxCON2<4:0>) are set to '00000'. Synchronous or Trigger modes are selected any time the SYNCSEL bits are set to any value except '00000'. The OCTRIG bit (OCxCON2<7>) selects either Synchronous or Trigger mode; setting the bit selects Trigger mode operation. In both modes, the SYNCSEL bits determine the sync/trigger source.

14.1.2 CASCADED (32-BIT) MODE

By default, each module operates independently with its own set of 16-Bit Timer and Duty Cycle registers. To increase resolution, adjacent even and odd modules can be configured to function as a single 32-bit module. (For example, modules 1 and 2 are paired, as are modules 3 and 4, and so on.) The odd-numbered module (OCx) provides the Least Significant 16 bits of the 32-bit register pairs, and the even module (OCy) provides the Most Significant 16 bits. Wraparounds of the OCx registers cause an increment of their corresponding OCy registers.

Cascaded operation is configured in hardware by setting the OC32 bits (OCxCON2<8>) for both modules.

REGISTER 17-1: UxMODE: UARTx MODE REGISTER (CONTINUED)

bit 4 **RXINV:** Receive Polarity Inversion bit
1 = UxRX Idle state is '0'
0 = UxRX Idle state is '1'

bit 3 **BRGH:** High Baud Rate Enable bit
1 = High-Speed mode (baud clock generated from FCY/4)
0 = Standard mode (baud clock generated from FCY/16)

bit 2-1 **PDSEL<1:0>:** Parity and Data Selection bits
11 = 9-bit data, no parity
10 = 8-bit data, odd parity
01 = 8-bit data, even parity
00 = 8-bit data, no parity

bit 0 **STSEL:** Stop Bit Selection bit
1 = Two Stop bits
0 = One Stop bit

Note 1: If UARTEN = 1, the peripheral inputs and outputs must be configured to an available RPn pin. See **Section 10.4 "Peripheral Pin Select"** for more information.

2: This feature is only available for the 16x BRG mode (BRGH = 0).

21.0 10-BIT HIGH-SPEED A/D CONVERTER

Note: This data sheet summarizes the features of this group of PIC24F devices. It is not intended to be a comprehensive reference source. For more information, refer to the *"PIC24F Family Reference Manual"*, **Section 17. "10-Bit A/D Converter"** (DS39705).

The 10-bit A/D Converter has the following key features:

- Successive Approximation (SAR) Conversion
- Conversion Speeds of up to 500 ksps
- 16 Analog Input pins
- External Voltage Reference Input pins
- Internal Band Gap Reference Inputs
- Automatic Channel Scan mode
- Selectable Conversion Trigger Source
- 16-Word Conversion Result Buffer
- Selectable Buffer Fill modes
- Four Result Alignment Options
- Operation during CPU Sleep and Idle modes

On all PIC24FJ256GA110 family devices, the 10-bit A/D Converter has 16 analog input pins, designated AN0 through AN15. In addition, there are two analog input pins for external voltage reference connections (V_{REF}+ and V_{REF}-). These voltage reference inputs may be shared with other analog input pins.

A block diagram of the A/D Converter is shown in Figure 21-1.

To perform an A/D conversion:

1. Configure the A/D module:
   a) Configure port pins as analog inputs and/or select band gap reference input (AD1PCFGL<15:0> and AD1PCFGH<1:0>).
   b) Select voltage reference source to match expected range on analog inputs (AD1CON2<15:13>).
   c) Select the analog conversion clock to match the desired data rate with the processor clock (AD1CON3<7:0>).
   d) Select the appropriate sample/conversion sequence (AD1CON1<7:5> and AD1CON3<12:8>).
   e) Select how conversion results are presented in the buffer (AD1CON1<9:8>).
   f) Select interrupt rate (AD1CON2<5:2>).
   g) Turn on A/D module (AD1CON1<15>).
2. Configure the A/D interrupt (if required):
   a) Clear the AD1IF bit.
   b) Select A/D interrupt priority.

TABLE 26-1: SYMBOLS USED IN OPCODE DESCRIPTIONS

Field	Description
#text	Means literal defined by "text"
(text)	Means "content of text"
[text]	Means "the location addressed by text"
{ }	Optional field or operation
<n:m>	Register bit field
.b	Byte mode selection
.d	Double-Word mode selection
.S	Shadow register select
.w	Word mode selection (default)
bit4	4-bit bit selection field (used in word addressed instructions) ∈ {0...15}
C, DC, N, OV, Z	MCU Status bits: Carry, Digit Carry, Negative, Overflow, Sticky Zero
Expr	Absolute address, label or expression (resolved by the linker)
f	File register address ∈ {0000h...1FFFh}
lit1	1-bit unsigned literal ∈ {0,1}
lit4	4-bit unsigned literal ∈ {0...15}
lit5	5-bit unsigned literal ∈ {0...31}
lit8	8-bit unsigned literal ∈ {0...255}
lit10	10-bit unsigned literal ∈ {0...255} for Byte mode, {0:1023} for Word mode
lit14	14-bit unsigned literal ∈ {0...16384}
lit16	16-bit unsigned literal ∈ {0...65535}
lit23	23-bit unsigned literal ∈ {0...8388608}; LSB must be '0'
None	Field does not require an entry, may be blank
PC	Program Counter
Slit10	10-bit signed literal ∈ {-512...511}
Slit16	16-bit signed literal ∈ {-32768...32767}
Slit6	6-bit signed literal ∈ {-16...16}
Wb	Base W register ∈ {W0..W15}
Wd	Destination W register ∈ { Wd, [Wd], [Wd++], [Wd--], [++Wd], [--Wd] }
Wdo	Destination W register ∈ { Wnd, [Wnd], [Wnd++], [Wnd--], [++Wnd], [--Wnd], [Wnd+Wb] }
Wm,Wn	Dividend, Divisor working register pair (direct addressing)
Wn	One of 16 working registers ∈ {W0..W15}
Wnd	One of 16 destination working registers ∈ {W0..W15}
Wns	One of 16 source working registers ∈ {W0..W15}
WREG	W0 (working register used in file register instructions)
Ws	Source W register ∈ { Ws, [Ws], [Ws++], [Ws--], [++Ws], [--Ws] }
Wso	Source W register ∈ { Wns, [Wns], [Wns++], [Wns--], [++Wns], [--Wns], [Wns+Wb] }

DC61p	2.8	5	µA	+60°C		
DC61h	2.8	5	µA	+85°C		
DC61l	5.6	10	µA	+125°C		

Note 1: Data in the Typical column is at 3.3V, 25°C unless otherwise stated. Parameters are for design guidance only and are not tested.

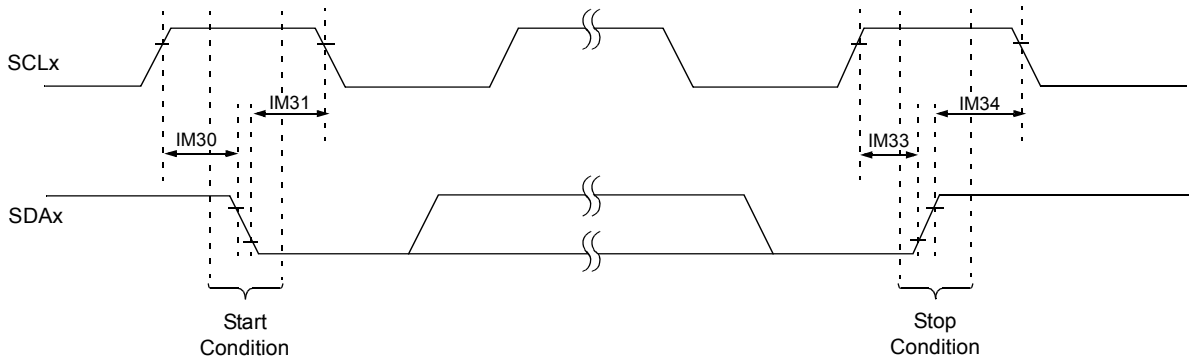
2: Base I_{PD} is measured with all peripherals and clocks shut down. All I/Os are configured as inputs and pulled high. WDT, etc., are all switched off.

3: On-chip voltage regulator disabled (ENVREG tied to V_{SS}).

4: On-chip voltage regulator enabled (ENVREG tied to V_{DD}).

5: The Δ current is the additional current consumed when the module is enabled. This current should be added to the base I_{PD} current.

FIGURE 28-17: I²C™ BUS START/STOP BITS TIMING CHARACTERISTICS (MASTER MODE)



Note: Refer to Figure 28-4 for load conditions.

TABLE 28-30: I²C™ BUS START/STOP BIT TIMING REQUIREMENTS (MASTER MODE)

AC CHARACTERISTICS				Standard Operating Conditions: 2.0V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C (Industrial)			
Param No.	**Symbol**	**Characteristic**		**Min(1)**	**Max**	**Units**	**Conditions**
IM30	TSU:STA	Start Condition Setup Time	100 kHz mode	TCY/2 (BRG + 1)	—	µs	Only relevant for Repeated Start condition
			400 kHz mode	TCY/2 (BRG + 1)	—	µs	
			1 MHz mode(2)	TCY/2 (BRG + 1)	—	µs	
IM31	THD:STA	Start Condition Hold Time	100 kHz mode	TCY/2 (BRG + 1)	—	µs	After this period, the first clock pulse is generated
			400 kHz mode	TCY/2 (BRG + 1)	—	µs	
			1 MHz mode(2)	TCY/2 (BRG + 1)	—	µs	
IM33	TSU:STO	Stop Condition Setup Time	100 kHz mode	TCY/2 (BRG + 1)	—	µs	—
			400 kHz mode	TCY/2 (BRG + 1)	—	µs	
			1 MHz mode(2)	TCY/2 (BRG + 1)	—	µs	
IM34	THD:STO	Stop Condition Hold Time	100 kHz mode	TCY/2 (BRG + 1)	—	ns	—
			400 kHz mode	TCY/2 (BRG + 1)	—	ns	
			1 MHz mode(2)	TCY/2 (BRG + 1)	—	ns	

Note 1: BRG is the value of the I²C™ Baud Rate Generator. Refer to **Section 16.3 "Setting Baud Rate When Operating as a Bus Master"** for details

2: Maximum pin capacitance = 10 pF for all I²C pins (for 1 MHz mode only).
