

Welcome to E-XFL.COM

What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "<u>Embedded -</u> <u>Microcontrollers</u>"

Details

E·XF

Details	
Product Status	Obsolete
Core Processor	PIC
Core Size	16-Bit
Speed	32MHz
Connectivity	I ² C, IrDA, LINbus, SPI, UART/USART
Peripherals	Brown-out Detect/Reset, LVD, POR, PWM, WDT
Number of I/O	85
Program Memory Size	64KB (22K x 24)
Program Memory Type	FLASH
EEPROM Size	-
RAM Size	16K x 8
Voltage - Supply (Vcc/Vdd)	2V ~ 3.6V
Data Converters	A/D 16x10b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 125°C (TA)
Mounting Type	Surface Mount
Package / Case	100-TQFP
Supplier Device Package	100-TQFP (12x12)
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/pic24fj64ga110-e-pt

Email: info@E-XFL.COM

Address: Room A, 16/F, Full Win Commercial Centre, 573 Nathan Road, Mongkok, Hong Kong

4.1.1 PROGRAM MEMORY ORGANIZATION

The program memory space is organized in word-addressable blocks. Although it is treated as 24 bits wide, it is more appropriate to think of each address of the program memory as a lower and upper word, with the upper byte of the upper word being unimplemented. The lower word always has an even address, while the upper word has an odd address (Figure 4-2).

Program memory addresses are always word-aligned on the lower word and addresses are incremented or decremented by two during code execution. This arrangement also provides compatibility with data memory space addressing and makes it possible to access data in the program memory space.

4.1.2 HARD MEMORY VECTORS

All PIC24F devices reserve the addresses between 00000h and 000200h for hard coded program execution vectors. A hardware Reset vector is provided to redirect code execution from the default value of the PC on device Reset to the actual start of code. A GOTO instruction is programmed by the user at 000000h with the actual address for the start of code at 000002h.

PIC24F devices also have two interrupt vector tables, located from 000004h to 0000FFh and 000100h to 0001FFh. These vector tables allow each of the many device interrupt sources to be handled by separate ISRs. A more detailed discussion of the interrupt vector tables is provided in **Section 7.1 "Interrupt Vector Table"**.

4.1.3 FLASH CONFIGURATION WORDS

In PIC24FJ256GA110 family devices, the top three words of on-chip program memory are reserved for configuration information. On device Reset, the configuration information is copied into the appropriate Configuration registers. The addresses of the Flash Configuration Word for devices in the PIC24FJ256GA110 family are shown in Table 4-1. Their location in the memory map is shown with the other memory vectors in Figure 4-1.

The Configuration Words in program memory are a compact format. The actual Configuration bits are mapped in several different registers in the configuration memory space. Their order in the Flash Configuration Words do not reflect a corresponding arrangement in the configuration space. Additional details on the device Configuration Words are provided in **Section 25.1** "**Configuration Bits**".

TABLE 4-1:	FLASH CONFIGURATION
	WORDS FOR
	PIC24FJ256GA110 FAMILY
	DEVICES

Device	Program Memory (Words)	Configuration Word Addresses				
PIC24FJ64GA	22,016	00ABFEh: 00AC00h				
PIC24FJ128GA	44,032	0157FAh: 0157FEh				
PIC24FJ192GA	67,072	020BFAh: 020BFEh

FIGURE 4-2: PROGRAM MEMORY ORGANIZATION

TABLE 4-30: PROGRAM SPACE ADDRESS CONSTRUCTION

	Access	Program Space Address					
Access Type	Space	<23>	<22:16>	<15>	<14:1>	<0>	
Instruction Access	User	0		PC<22:1>		0	
(Code Execution)			0xx xxxx x	xxx xxxx	xxxx xxx0		
TBLRD/TBLWT	User	TBLPAG<7:0>		Data EA<15:0>			
(Byte/Word Read/Write)		02	xxx xxxx	x xxxx xxxx xxxx xxx		xxx	
	Configuration	TBLPAG<7:0> Data EA<15:0		Data EA<15:0>			
		1xxx xxxx		XXXX XXXX XXXX XXXX		xxx	
Program Space Visibility	ity User		0 PSVPAG<7		<7:0> Data EA<14:0> ⁽¹⁾		
(Block Remap/Read)		0	XXXX XXX	xx	XXX XXXX XXX	x xxxx	

Note 1: Data EA<15> is always '1' in this case, but is not used in calculating the program space address. Bit 15 of the address is PSVPAG<0>.

FIGURE 4-5: DATA ACCESS FROM PROGRAM SPACE ADDRESS GENERATION

- **Note 1:** The LSb of program space addresses is always fixed as '0' in order to maintain word alignment of data in the program and data spaces.
 - **2:** Table operations are not required to be word-aligned. Table read operations are permitted in the configuration memory space.

FLASH PROGRAM MEMORY 5.0

Note:	This data sheet summarizes the features of									
	this group of PIC24F devices. It is not									
	intended to be a comprehensive reference									
	source. For more information, refer to the									
	"PIC24F Family Reference Manual",									
	Section 4. "Program Memory"									
	(DS39715).									

The PIC24FJ256GA110 family of devices contains internal Flash program memory for storing and executing application code. The memory is readable, writable and erasable when operating with VDD over 2.35V. If the regulator is disabled, the VDDCORE voltage must be over 2.25V.

Flash memory can be programmed in three ways:

- In-Circuit Serial Programming[™] (ICSP[™])
- Run-Time Self-Programming (RTSP)
- Enhanced In-Circuit Serial Programming (Enhanced ICSP)

ICSP allows a PIC24FJ256GA110 family device to be serially programmed while in the end application circuit. This is simply done with two lines for the programming clock and programming data (which are named PGECx and PGEDx, respectively), and three other lines for power (VDD), ground (VSS) and Master Clear (MCLR). This allows customers to manufacture boards with unprogrammed devices and then program the microcontroller just before shipping the product. This also allows the most recent firmware or a custom firmware to be programmed.

RTSP is accomplished using TBLRD (table read) and TBLWT (table write) instructions. With RTSP, the user may write program memory data in blocks of 64 instructions (192 bytes) at a time and erase program memory in blocks of 512 instructions (1536 bytes) at a time.

5.1 **Table Instructions and Flash** Programming

Regardless of the method used, all programming of Flash memory is done with the table read and table write instructions. These allow direct read and write access to the program memory space from the data memory while the device is in normal operating mode. The 24-bit target address in the program memory is formed using the TBLPAG<7:0> bits and the Effective Address (EA) from a W register specified in the table instruction, as shown in Figure 5-1.

The TBLRDL and the TBLWTL instructions are used to read or write to bits<15:0> of program memory. TBLRDL and TBLWTL can access program memory in both Word and Byte modes.

The TBLRDH and TBLWTH instructions are used to read or write to bits<23:16> of program memory. TBLRDH and TBLWTH can also access program memory in Word or Byte mode.

FIGURE 5-1: ADDRESSING FOR TABLE REGISTERS

EXAMPLE 5-2: ERASING A PROGRAM MEMORY BLOCK (C LANGUAGE CODE)

<pre>// C example using MPLAB C30 unsigned long progAddr = 0xXXXXXX; unsigned int offset;</pre>	// Address of row to write
//Set up pointer to the first memory locatio	n to be written
TBLPAG = progAddr>>16;	// Initialize PM Page Boundary SFR
offset = progAddr & 0xFFFF;	// Initialize lower word of address
<pre>builtin_tblwtl(offset, 0x0000);</pre>	<pre>// Set base address of erase block // with dummy latch write</pre>
NVMCON = 0×4042 ;	// Initialize NVMCON
asm("DISI #5"); builtin_write_NVM();	<pre>// Block all interrupts with priority <7 // for next 5 instructions // C30 function to perform unlock // sequence and set WR</pre>

6.0 RESETS

Note: This data sheet summarizes the features of this group of PIC24F devices. It is not intended to be a comprehensive reference source. For more information, refer to the "PIC24F Family Reference Manual", Section 7. "Reset" (DS39712).

The Reset module combines all Reset sources and controls the device Master Reset Signal, SYSRST. The following is a list of device Reset sources:

- POR: Power-on Reset
- MCLR: Pin Reset
- SWR: RESET Instruction
- · WDT: Watchdog Timer Reset
- · BOR: Brown-out Reset
- CM: Configuration Mismatch Reset
- TRAPR: Trap Conflict Reset
- IOPUWR: Illegal Opcode Reset
- UWR: Uninitialized W Register Reset

A simplified block diagram of the Reset module is shown in Figure 6-1.

Any active source of Reset will make the SYSRST signal active. Many registers associated with the CPU and peripherals are forced to a known Reset state. Most registers are unaffected by a Reset; their status is unknown on POR and unchanged by all other Resets.

Refer to the specific peripheral or CPU Note: section of this manual for register Reset states.

All types of device Reset will set a corresponding status bit in the RCON register to indicate the type of Reset (see Register 6-1). A Power-on Reset will clear all bits except for the BOR and POR bits (RCON<1:0>) which are set. The user may set or clear any bit at any time during code execution. The RCON bits only serve as status bits. Setting a particular Reset status bit in software will not cause a device Reset to occur.

The RCON register also has other bits associated with the Watchdog Timer and device power-saving states. The function of these bits is discussed in other sections of this data sheet.

Note: The status bits in the RCON register should be cleared after they are read so that the next RCON register value after a device Reset will be meaningful.

REGISTER 7-3: INTCON1: INTERRUPT CONTROL REGISTER 1

8.1 CPU Clocking Scheme

The system clock source can be provided by one of four sources:

- Primary Oscillator (POSC) on the OSCI and OSCO pins
- Secondary Oscillator (SOSC) on the SOSCI and SOSCO pins
- Fast Internal RC (FRC) Oscillator
- · Low-Power Internal RC (LPRC) Oscillator

The Primary Oscillator and FRC sources have the option of using the internal 4x PLL. The frequency of the FRC clock source can optionally be reduced by the programmable clock divider. The selected clock source generates the processor and peripheral clock sources.

The processor clock source is divided by two to produce the internal instruction cycle clock, FCY. In this document, the instruction cycle clock is also denoted by FOSC/2. The internal instruction cycle clock, FOSC/2, can be provided on the OSCO I/O pin for some operating modes of the Primary Oscillator.

8.2 Initial Configuration on POR

The oscillator source (and operating mode) that is used at a device Power-on Reset event is selected using Configuration bit settings. The oscillator Configuration bit settings are located in the Configuration registers in the program memory (refer to Section 25.1 "Configuration Bits" for further details). The Primary Configuration bits, POSCMD<1:0> Oscillator (Configuration Word 2<1:0>), and the Initial Oscillator Select Configuration bits. FNOSC<2:0> (Configuration Word 2<10:8>), select the oscillator source that is used at a Power-on Reset. The FRC Primary Oscillator with Postscaler (FRCDIV) is the default (unprogrammed) selection. The Secondary Oscillator, or one of the internal oscillators, may be chosen by programming these bit locations.

The Configuration bits allow users to choose between the various clock modes, shown in Table 8-1.

8.2.1 CLOCK SWITCHING MODE CONFIGURATION BITS

The FCKSM Configuration bits (Configuration Word 2<7:6>) are used to jointly configure device clock switching and the Fail-Safe Clock Monitor (FSCM). Clock switching is enabled only when FCKSM1 is programmed ('0'). The FSCM is enabled only when FCKSM<1:0> are both programmed ('00').

Oscillator Mode	Oscillator Source	POSCMD<1:0>	FNOSC<2:0>	Note
Fast RC Oscillator with Postscaler (FRCDIV)	Internal	11	111	1, 2
(Reserved)	Internal	xx	110	1
Low-Power RC Oscillator (LPRC)	Internal	11	101	1
Secondary (Timer1) Oscillator (SOSC)	Secondary	11	100	1
Primary Oscillator (XT) with PLL Module (XTPLL)	Primary	01	011	
Primary Oscillator (EC) with PLL Module (ECPLL)	Primary	00	011	
Primary Oscillator (HS)	Primary	10	010	
Primary Oscillator (XT)	Primary	01	010	
Primary Oscillator (EC)	Primary	00	010	
Fast RC Oscillator with PLL Module (FRCPLL)	Internal	11	001	1
Fast RC Oscillator (FRC)	Internal	11	000	1

TABLE 8-1: CONFIGURATION BIT VALUES FOR CLOCK SELECTION

Note 1: OSCO pin function is determined by the OSCIOFCN Configuration bit.

2: This is the default oscillator mode for an unprogrammed (erased) device.

10.4.6 PERIPHERAL PIN SELECT REGISTERS

The PIC24FJ256GA110 family of devices implements a total of 37 registers for remappable peripheral configuration:

- Input Remappable Peripheral Registers (21)
- Output Remappable Peripheral Registers (16)

Note: Input and output register values can only be changed if IOLOCK (OSCCON<6>) = 0. See Section 10.4.4.1 "Control Register Lock" for a specific command sequence.

When TCS = 0: 1 = Gated time accumulation enabled 0 = Gated time accumulation disabled bit 5-4 TCKPS<1:0>: Timery Input Clock Prescale Select bits⁽¹⁾ 11 = 1:256 10 = 1:64 01 = 1:8 00 = 1:1 bit 3-2 Unimplemented: Read as '0' TCS: Timery Clock Source Select bit^(1,2) bit 1 1 = External clock from pin TyCK (on the rising edge) 0 = Internal clock (Fosc/2) bit 0 Unimplemented: Read as '0' **Note 1:** When 32-bit operation is enabled (T2CON<3> or T4CON<3> = 1), these bits have no effect on Timery operation; all timer functions are set through T2CON and T4CON.

- 2: If TCS = 1, RPINRx (TyCK) must be configured to an available RPn pin. See Section 10.4 "Peripheral **Pin Select**" for more information.
- **3:** Changing the value of TyCON while the timer is running (TON = 1) causes the timer prescale counter to reset and is not recommended.

19.0 REAL-TIME CLOCK AND CALENDAR (RTCC)

Note: This data sheet summarizes the features of this group of PIC24F devices. It is not intended to be a comprehensive reference source. For more information, refer to the "PIC24F Family Reference Manual", Section 29. "Real-Time Clock and Calendar (RTCC)" (DS39696).

The Real-Time Clock and Calendar (RTCC) provides on-chip, hardware-based clock and calendar functionality with little or no CPU overhead. It is intended for applications where accurate time must be maintained for extended periods with minimal CPU activity and with limited power resources, such as battery-powered applications. Key features include:

- Time data in hours, minutes and seconds, with a granularity of one-half second
- 24-hour format (military time) display option
- · Calendar data as date, month and year
- Automatic, hardware-based day of week and leap year calculations for dates from 2000 through 2099
- Time and calendar data in BCD format for compact firmware
- Highly configurable alarm function
- External output pin with selectable alarm signal or seconds "tick" signal output
- · User calibration feature with auto-adjust

A simplified block diagram of the module is shown in Figure 19-1.The SOSC and RTCC will both remain running while the device is held in Reset with MCLR and will continue running after MCLR is released.

FIGURE 19-1: RTCC BLOCK DIAGRAM

TABLE 28-13: EXTERNAL CLOCK TIMING REQUIREMENTS

AC CHARACTERISTICS		$\begin{array}{llllllllllllllllllllllllllllllllllll$					
Param No.	Sym	Characteristic	Min	Typ ⁽¹⁾	Max	Units	Conditions
OS10	Fosc	External CLKI Frequency (external clocks allowed only in EC mode)	DC 4	_	32 8	MHz MHz	EC ECPLL
		Oscillator Frequency	3 4 10 31	 	10 8 32 33	MHz MHz MHz kHz	XT XTPLL HS SOSC
OS20	Tosc	Tosc = 1/Fosc	_	—	—	-	See Parameter OS10 for Fosc value
OS25	Тсү	Instruction Cycle Time ⁽²⁾	62.5	_	DC	ns	
OS30	TosL, TosH	External Clock in (OSCI) High or Low Time	0.45 x Tosc	—	_	ns	EC
OS31	TosR, TosF	External Clock in (OSCI) Rise or Fall Time	-	—	20	ns	EC
OS40	TckR	CLKO Rise Time ⁽³⁾	—	6	10	ns	
OS41	TckF	CLKO Fall Time ⁽³⁾	—	6	10	ns	

Note 1: Data in "Typ" column is at 3.3V, 25°C unless otherwise stated. Parameters are for design guidance only and are not tested.

- 2: Instruction cycle period (Tcr) equals two times the input oscillator time base period. All specified values are based on characterization data for that particular oscillator type under standard operating conditions with the device executing code. Exceeding these specified limits may result in an unstable oscillator operation and/or higher than expected current consumption. All devices are tested to operate at "Min." values with an external clock applied to the OSCI/CLKI pin. When an external clock input is used, the "Max." cycle time limit is "DC" (no clock) for all devices.
- **3:** Measurements are taken in EC mode. The CLKO signal is measured on the OSCO pin. CLKO is low for the Q1-Q2 period (1/2 TCY) and high for the Q3-Q4 period (1/2 TCY).
