Welcome to E-XFL.COM

What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "<u>Embedded -</u> <u>Microcontrollers</u>"

Details

Product Status	Obsolete
Core Processor	80C51
Core Size	8-Bit
Speed	40/20MHz
Connectivity	UART/USART
Peripherals	POR
Number of I/O	32
Program Memory Size	8KB (8K x 8)
Program Memory Type	ОТР
EEPROM Size	-
RAM Size	256 x 8
Voltage - Supply (Vcc/Vdd)	4.5V ~ 5.5V
Data Converters	-
Oscillator Type	Internal
Operating Temperature	0°C ~ 70°C (TA)
Mounting Type	Surface Mount
Package / Case	44-QFP
Supplier Device Package	44-PQFP
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/ts87c52x2-mcc

Email: info@E-XFL.COM

Address: Room A, 16/F, Full Win Commercial Centre, 573 Nathan Road, Mongkok, Hong Kong

Mnemonic	Pin Number Type Name and Function				Name and Function
	DIL	LCC	VQFP 1.4		
	13	15	9	I	INT1 (P3.3): External interrupt 1
	14	16	10	I	T0 (P3.4): Timer 0 external input
	15	17	11	I	T1 (P3.5): Timer 1 external input
	16	18	12	0	WR (P3.6): External data memory write strobe
	17	19	13	0	RD (P3.7): External data memory read strobe
Reset	9	10	4	I	Reset: A high on this pin for two machine cycles while the oscillator is running, resets the device. An internal diffused resistor to V_{SS} permits a power-on reset using only an external capacitor to V_{CC} .
ALE/PROG	30	33	27	O (I)	Address Latch Enable/Program Pulse: Output pulse for latching the low byte of the address during an access to external memory. In normal operation, ALE is emitted at a constant rate of 1/6 (1/3 in X2 mode) the oscillator frequency, and can be used for external timing or clocking. Note that one ALE pulse is skipped during each access to external data memory. This pin is also the program pulse input (PROG) during EPROM programming. ALE can be disabled by setting SFR's AUXR.0 bit. With this bit set, ALE will be inactive during internal fetches.
PSEN	29	32	26	0	Program Store ENable: The read strobe to external program memory. When executing code from the external program memory, <u>PSEN</u> is activated twice each machine cycle, except that two <u>PSEN</u> activations are skipped during each access to external data memory. <u>PSEN</u> is not activated during fetches from internal program memory.
ĒĀ/V _{PP}	31	35	29	I	External Access Enable/Programming Supply Voltage: EA must be externally held low to enable the device to fetch code from external program memory locations 0000H and 3FFFH (RB) or 7FFFH (RC), or FFFFH (RD). If EA is held high, the device executes from internal program memory unless the program counter contains an address greater than 3FFFH (RB) or 7FFFH (RC) EA must be held low for ROMless devices. This pin also receives the 12.75V programming supply voltage (V _{PP}) during EPROM programming. If security level 1 is programmed, EA will be internally latched on Reset.
XTAL1	19	21	15	I	Crystal 1: Input to the inverting oscillator amplifier and input
					to the internal clock generator circuits.
XTAL2	18	20	14	0	Crystal 2: Output from the inverting oscillator amplifier

Application

Software can take advantage of the additional data pointers to both increase speed and reduce code size, for example, block operations (copy, compare, search ...) are well served by using one data pointer as a 'source' pointer and the other one as a "destination" pointer.

ASSEMBLY LANGUAGE

; Block move using dual data pointers ; Destroys DPTR0, DPTR1, A and PSW ; note: DPS exits opposite of entry state ; unless an extra INC AUXR1 is added 00A2 AUXR1 EQU 0A2H 0000 909000MOV DPTR,#SOURCE ; address of SOURCE 0003 05A2 INC AUXR1 ; switch data pointers 0005 90A000 MOV DPTR,#DEST ; address of DEST 0008 LOOP: 0008 05A2 INC AUXR1 ; switch data pointers 000A E0 MOVX A, atDPTR ; get a byte from SOURCE 000B A3 INC DPTR ; increment SOURCE address 000C 05A2 INC AUXR1 ; switch data pointers 000E F0 MOVX atDPTR, A ; write the byte to DEST 000F A3 INC DPTR ; increment DEST address 0010 70F6JNZ LOOP ; check for 0 terminator 0012 05A2 INC AUXR1 ; (optional) restore DPS

INC is a short (2 bytes) and fast (12 clocks) way to manipulate the DPS bit in the AUXR1 SFR. However, note that the INC instruction does not directly force the DPS bit to a particular state, but simply toggles it. In simple routines, such as the block move example, only the fact that DPS is toggled in the proper sequence matters, not its actual value. In other words, the block move routine works the same whether DPS is '0' or '1' on entry. Observe that without the last instruction (INC AUXR1), the routine will exit with DPS in the opposite state.

Table 6. T2MOD Register

T2MOD - Timer 2 Mode Control Register (C9h)

7	6	5	4	3	2	1	0		
-	-	-	-	-	-	T2OE	DCEN		
Bit Number	Bit Mnemonic	Description							
7	-	Reserved The value rea	ad from this b	it is indetermir	nate. Do not s	et this bit.			
6	-	Reserved The value rea	ad from this b	it is indetermir	nate. Do not s	et this bit.			
5	-	Reserved The value rea	ad from this b	it is indetermir	nate. Do not s	et this bit.			
4	-	Reserved The value rea	ad from this b	it is indetermir	nate. Do not se	et this bit.			
3	-	Reserved The value rea	Reserved The value read from this bit is indeterminate. Do not set this bit.						
2	-	Reserved The value rea	Reserved The value read from this bit is indeterminate. Do not set this bit.						
1	T2OE	Clear to prog		it as clock input clock output.					
0	DCEN	Clear to disa		t up/down cou b/down counte					

Reset Value = XXXX XX00b Not bit addressable
