
Welcome to E-XFL.COM

What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Active
Core Processor	eZ8
Core Size	8-Bit
Speed	20MHz
Connectivity	-
Peripherals	Brown-out Detect/Reset, LED, POR, PWM, WDT
Number of I/O	17
Program Memory Size	4KB (4K x 8)
Program Memory Type	FLASH
EEPROM Size	-
RAM Size	256 x 8
Voltage - Supply (Vcc/Vdd)	2.7V ~ 3.6V
Data Converters	A/D 7x10b
Oscillator Type	Internal
Operating Temperature	0°C ~ 70°C (TA)
Mounting Type	Surface Mount
Package / Case	20-SOIC (0.295", 7.50mm Width)
Supplier Device Package	20-SOIC
Purchase URL	https://www.e-xfl.com/product-detail/zilog/z8f043ash020sg

Table 4. Signal Descriptions (Continued)

Signal Mnemonic	I/O	Description
LED Drivers		
LED	O	Direct LED drive capability. All Port C pins have the capability to drive an LED without any other external components. These pins have programmable drive strengths set by the GPIO block.
On-Chip Debugger		
DBG	I/O	Debug. This signal is the control and data input and output to and from the On-Chip Debugger. **Caution:** The DBG pin is open-drain and requires an external pull-up resistor to ensure proper operation.
Reset		
$\overline{\text{RESET}}$	I/O	RESET. Generates a reset when asserted (driven Low). Also serves as a reset indicator; the Z8 Encore! forces this pin low when in reset. This pin is open-drain and features an enabled internal pull-up resistor.
Power Supply		
V_{DD}	I	Digital power supply.
AV_{DD}	I	Analog power supply.
V_{SS}	I	Digital ground.
AV_{SS}	I	Analog ground.

Program Memory

The eZ8 CPU supports 64KB of program memory address space. The Z8 Encore! F083A Series devices contain 1KB to 12KB of on-chip Flash memory in the program memory address space, depending on the device. Reading from program memory addresses outside the available Flash memory addresses returns FFH. Writing to these unimplemented program memory addresses produces no effect. Table 6 describes the program memory maps for the Z8 Encore! F083A Series products.

Table 6. Z8 Encore! F083A Series Program Memory Maps

Program Memory Address (Hex)	Function
Z8F083A Products	
0000–0001	Flash Option Bits
0002–0003	Reset Vector
0004–003D	Interrupt Vectors*
003E–1FFF	Program Memory
Z8F043A Products	
0000–0001	Flash Option Bits
0002–0003	Reset Vector
0004–003D	Interrupt Vectors*
003E–0FFF	Program Memory

Note: *See Table 34 on page 55 for a list of interrupt vectors.

Data Memory

The Z8 Encore! F083A Series does not use the eZ8 CPU's 64KB data memory address space.

Flash Information Area

Table 7 indicates the Z8 Encore! F083A Series MCUs' Flash information area. This 128-byte information area is accessed by setting bit 7 of the Flash Page Select Register to 1. When access is enabled, the Flash information area is mapped into program memory and overlays the 128 bytes at addresses FE00H to FE7FH. When information area access is enabled, all reads from these program memory addresses return information area data rather than program memory data. Access to the Flash information area is read-only.

Table 8. Register File Address Map (Continued)

Address (Hex)	Register Description	Mnemonic	Reset (Hex)	Page #
Trim Bit Control				
FF6	Trim Bit Address	TRMADR	00	126
FF7	Trim Data	TRMDR	XX	127
Flash Memory Controller				
FF8	Flash Control	FCTL	00	120
FF8	Flash Status	FSTAT	00	121
FF9	Flash Page Select	FPS	00	122
	Flash Sector Protect	FPROT	00	122
FFA	Flash Programming Frequency High Byte	FFREQH	00	123
FFB	Flash Programming Frequency Low Byte	FFREQL	00	123
eZ8 CPU				
FFC	Flags	—	XX	Refer to the eZ8 CPU Core User Manual (UM0128)
FFD	Register Pointer	RP	XX	
FFE	Stack Pointer High Byte	SPH	XX	
FFF	Stack Pointer Low Byte	SPL	XX	

Note: XX = Undefined.

Table 9. Reset and Stop Mode Recovery Characteristics and Latency

	Reset Characteristics and Latency		
Reset Type	**Control Registers**	**eZ8 CPU**	**Reset Latency (Delay)**
System Reset	Reset (as applicable)	Reset	About 66 internal precision oscillator cycles.
System Reset with Crystal Oscillator Enabled	Reset (as applicable)	Reset	About 5000 internal precision oscillator cycles.
Stop Mode Recovery	Unaffected, except WDT_CTL and OSC_CTL registers	Reset	About 66 internal precision oscillator cycles.
Stop Mode Recovery with crystal oscillator enabled	Unaffected, except WDT_CTL and OSC_CTL registers	Reset	About 5000 internal precision oscillator cycles.

During a system Reset or Stop Mode Recovery, the Z8 Encore! F083A Series device is held in reset for about 66 cycles of the internal precision oscillator. If the crystal oscillator is enabled in the Flash option bits, the reset period is increased to about 5000 IPO cycles. When a reset occurs because of a low voltage condition or POR, the reset delay is measured from the time the supply voltage first exceeds the POR level (discussed later in this chapter). If the external pin reset remains asserted at the end of the reset period, the device remains in reset until the pin is deasserted.

At the beginning of reset, all GPIO pins are configured as inputs with pull-up resistor disabled, except PD0 which is shared with the reset pin. On Reset, the Port D0 pin is configured as a bidirectional open-drain reset. This pin is internally driven low during port reset, after which the user code reconfigures this pin as a general purpose output.

During reset, the eZ8 CPU and on-chip peripherals are idle; however, the on-chip crystal oscillator and Watchdog Timer Oscillator continues to run.

On reset, control registers within the Register File that have a defined reset value are loaded with their reset values. Other control registers (including the Stack Pointer, Register Pointer and Flags) and general purpose RAM are undefined following the reset. The eZ8 CPU fetches the reset vector at program memory addresses `0002H` and `0003H` and loads that value into the program counter. Program execution begins at the reset vector address.

Because the control registers are reinitialized by a system reset, the system clock after reset is always the IPO. User software must reconfigure the oscillator control block, to enable and select the correct system clock source.

General Purpose Input/Output

The Z8 Encore! F083A Series products support a maximum of 23 port pins (Port A–D) for general purpose input/output (GPIO) operations. Each port contains control and data registers. The GPIO control registers determine data direction, open-drain, output drive current, programmable pull-ups, Stop Mode Recovery functionality and alternate pin functions. Each port pin is individually programmable. In addition, the Port C pins are capable of direct LED drive at programmable drive strengths.

GPIO Port Availability by Device

Table 15 lists the port pins available with each device and package type.

Table 15. Port Availability by Device and Package Type

Devices	Package	10-Bit ADC	Port A	Port B	Port C	Port D	Total I/O
Z8F083A, Z8F043A	20-pin	Yes	[7:0]	[3:0]	[3:0]	[0]	17
Z8F083A, Z8F043A	28-pin	Yes	[7:0]	[5:0]	[7:0]	[0]	23

Note: 20-pin and 28-pin and 10-bit ADC Enabled or Disabled can be selected via the option bits.

Architecture

Figure 8 displays a simplified block diagram of a GPIO port pin. In this figure, the ability to accommodate alternate functions and variable port current drive strength is not displayed.

LED Drive Level High Register

The LED Drive Level High Register, shown in Table 32, contains two control bits for each Port C pin. These two bits selects one of four programmable current drive levels for each Port C pin. Each pin is individually programmable.

Table 32. LED Drive Level High Register (LEDLVLH)

Bit	7	6	5	4	3	2	1	0
Field	LEDLVLH[7:0]							
RESET	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Address	F83H							

Bit	Description
[7:0] LEDLVLH	**LED Level High Bits** {LEDLVLH, LEDLVLL} select one of four programmable current drive levels for each Port C pin. 00 = 3mA. 01 = 7mA. 10 = 13mA. 11 = 20mA.

Bit	Description (Continued)
[2:0] TMODE	**TIMER Mode** This field along with the TMODEHI bit in TxCTL0 register determines the operating mode of the timer. TMODEHI is the most significant bit of the timer mode selection value. 0000 = ONE-SHOT Mode. 0001 = CONTINUOUS Mode. 0010 = COUNTER Mode. 0011 = PWM SINGLE OUTPUT Mode. 0100 = CAPTURE Mode. 0101 = COMPARE Mode. 0110 = GATED Mode. 0111 = CAPTURE/COMPARE Mode. 1000 = PWM DUAL OUTPUT Mode. 1001 = CAPTURE RESTART Mode. 1010 = COMPARATOR COUNTER Mode.

Watchdog Timer Reload Upper, High and Low Byte Registers

The Watchdog Timer Reload Upper, High and Low Byte (WDTU, WDTH, WDTL) registers, shown in Tables 60 through 62, form the 24-bit reload value{WDTU[7:0], WDTH[7:0], WDTL[7:0]} that is loaded into the Watchdog Timer when a WDT instruction is executed. Writing to these registers sets the appropriate reload value; reading from these registers returns the current Watchdog Timer count value.

! Caution: The 24-bit WDT reload value must not be set to a value less than 000004H.

Table 60. Watchdog Timer Reload Upper Byte Register (WDTU)

Bit	7	6	5	4	3	2	1	0
Field	WDTU							
RESET	0	0	0	0	0	0	0	0
R/W	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*
Address	FF1H							

Note: *R/W = A read returns the current WDT count value; a write sets the appropriate reload value.

Bit	Description
[7:0] WDTU	**WDT Reload Upper Byte** MSB, Bits[23:16], of the 24-bit WDT reload value.

Table 61. Watchdog Timer Reload High Byte Register (WDTH)

Bit	7	6	5	4	3	2	1	0
Field	WDTH							
RESET	0	0	0	0	0	1	0	0
R/W	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*
Address	FF2H							

Note: *R/W = A read returns the current WDT count value; a write sets the appropriate reload value.

Bit	Description
[7:0] WDTH	**WDT Reload High Byte** Middle byte, bits[15:8] of the 24-bit WDT reload value.

Sample Time Register

The sample time register, shown in Table 67, is used to program the length of active time for the sample after a conversion has begun by setting the START bit in the ADC Control Register. The number of system clock cycles required for the sample time varies from system to system, depending on the clock period used. The system designer must program this register to contain the number of system clocks required to meet a 1µs minimum sample time.

Table 67. Sample Time (ADCST)

Bit	7	6	5	4	3	2	1	0
Field	Reserved		ST					
RESET	0		1	1	1	1	1	1
R/W	R/W		R/W					
Address	F75H							

Bit	Description
[7:6]	**Reserved** These bits are reserved and must be programmed to 00.
[5:0] ST	**Sample/Hold Time** Measured in number of system clock periods to meet 1µs minimum.

Comparator Control Register Definition

The Comparator Control Register (CMPCTL) configures the comparator inputs and sets the value of the internal voltage reference. The GPIO pin always used as positive comparator input.

Table 69. Comparator Control Register (CMP0)

Bit	7	6	5	4	3	2	1	0
Field	Reserved	INNSEL	REFLVL				Reserved	
RESET	0	0	0	1	0	1	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Address	F90H							

Bit	Description
[7]	**Reserved** This bit is reserved and must be programmed to 0.
[6] INNSEL	**Signal Select for Negative Input** 0 = internal reference disabled, GPIO pin used as negative comparator input. 1 = internal reference enabled as negative comparator input.
[5:2] REFLVL	**Internal Reference Voltage Level** This reference is independent of the ADC voltage reference. 0000 = 0.0V. 0001 = 0.2V. 0010 = 0.4V. 0011 = 0.6V. 0100 = 0.8V. 0101 = 1.0V (Default). 0110 = 1.2V. 0111 = 1.4V. 1000 = 1.6V. 1001 = 1.8V. 1010–1111 = Reserved.
[1:0]	**Reserved** These bits are reserved and must be programmed to 00.

Note: The bit values used in Table 88 are set at the factory; no calibration is required.

Table 89. VBO Trim Definition

VBO_TRIM	Trigger Voltage Level
000	1.7
001	1.6
101	2.2
110	2.0
100	2.4
111	1.8

The F083A Series' on-chip Flash memory only guarantees write operations with a voltage supply over 2.7V. Write operations below 2.7V may cause unpredictable results.

Trim Bit Address 0006H

Table 90. Trim Option Bits at 0006H (TCLKFLT)

Bit	7	6	5	4	3	2	1	0
Field	DivBy4	Reserved	DlyCtl1	DlyCtl2	DlyCtl3	Reserved	FilterSel1	FilterSel0
RESET	0	1	0	0	0	1	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Address	Information Page Memory 0026H							

Note: U = Unchanged by Reset; R/W = Read/Write.

Bit	Description
[7] DivBy4	**Output Frequency Selection** 0 = Output frequency is input frequency. 1 = Output frequency is 1/4 of the input frequency.
[6]	**Reserved** This bit is reserved and must be programmed to 1.
[5:3] DlyCtl*x*	**Delay Control** Filtered 3-bit pulse width selection. For 3.3V operation, see Table 91.

Notes: x indicates bit values 3–1; y indicates bit values 1–0.

ister, the user code must wait at least 5000 IPO cycles for the crystal to stabilize. After this, the crystal oscillator may be selected as the system clock.

Figure 22 displays a recommended configuration for connection with an external fundamental-mode, parallel-resonant crystal operating at 20 MHz. Recommended 20 MHz crystal specifications are provided in Table 101. Resistor R_1 is optional and limits total power dissipation by the crystal. Printed circuit board layout must add no more than 4 pF of stray capacitance to either the X_{IN} or X_{OUT} pins. If oscillation does not occur, reduce the values of capacitors C_1 and C_2 to decrease loading.

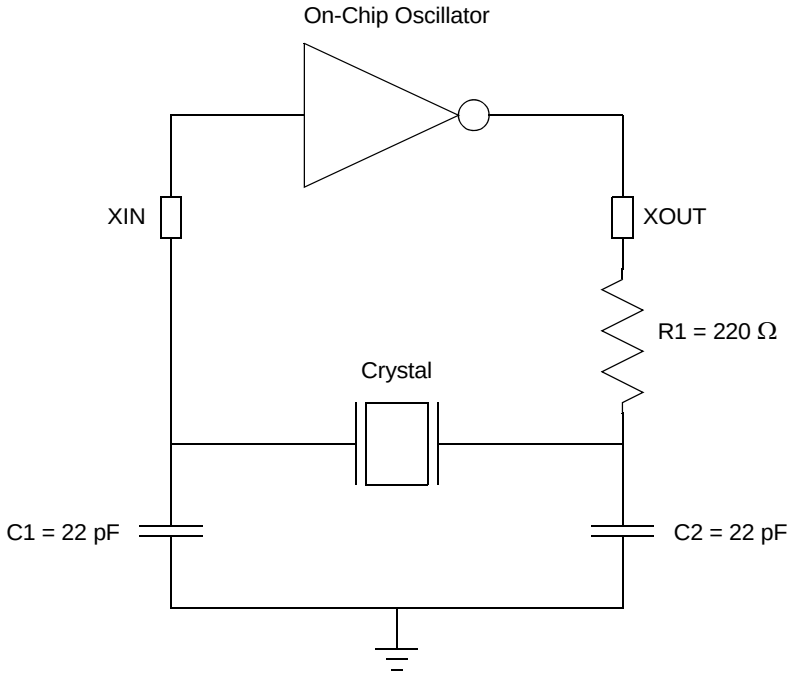

Figure 22. Recommended 20 MHz Crystal Oscillator Configuration

Table 101. Recommended Crystal Oscillator Specifications

Parameter	Value	Units	Comments
Frequency	20	MHz	
Resonance	Parallel		
Mode	Fundamental		
Series Resistance (R_S)	60	Ω	Maximum
Load Capacitance (C_L)	30	pF	Maximum
Shunt Capacitance (C_0)	7	pF	Maximum
Drive Level	1	mW	Maximum

Table 103. Assembly Language Syntax Example 2

Assembly Language Code	ADD	43H,	R8	(ADD dst, src)
Object Code	04	E8	43	(OPC src, dst)

The Register File size varies, depending on the device type. See the device-specific Z8 Encore! product specification to determine the exact Register File range available.

eZ8 CPU Instruction Notation

In the eZ8 CPU instruction summary and description sections, the operands, condition codes, status flags and address modes are represented by a notational shorthand that is described in Table 104.

Table 104. Notational Shorthand

Notation	Description	Operand	Range
b	Bit	b	b represents a value from 0 to 7 (000B to 111B).
cc	Condition Code	—	See the condition codes overview in the eZ8 CPU Core User Manual (UM0128).
DA	Direct Address	Addrs	*Addrs* represents a number in the range of 0000H to FFFFH.
ER	Extended addressing Register	Reg	*Reg* represents a number in the range of 000H to FFFH.
IM	Immediate Data	#Data	Data is a number between 00H to FFH/
Ir	Indirect Working Register	@Rn	n = 0–15.
IR	Indirect Register	@Reg	*Reg* represents a number in the range of 00H to FFH/
Irr	Indirect Working Register Pair	@RRp	p = 0, 2, 4, 6, 8, 10, 12 or 14.
IRR	Indirect Register Pair	@Reg	*Reg* represents an even number in the range 00H to FEH.
p	Polarity	p	Polarity is a single bit binary value of either 0B or 1B.
r	Working Register	Rn	n = 0–15.
R	Register	Reg	Reg. represents a number in the range of 00H to FFH.
