
Welcome to E-XFL.COM

Understanding Embedded - Microprocessors

Embedded microprocessors are specialized computing chips designed to perform specific tasks within an embedded system. Unlike general-purpose microprocessors found in personal computers, embedded microprocessors are tailored for dedicated functions within larger systems, offering optimized performance, efficiency, and reliability. These microprocessors are integral to the operation of countless electronic devices, providing the computational power necessary for controlling processes, handling data, and managing communications.

Applications of Embedded - Microprocessors

Embedded microprocessors are utilized across a broad spectrum of applications, making them indispensable in

Details	
Product Status	Obsolete
Core Processor	MIPS32
Number of Cores/Bus Width	1 Core, 32-Bit
Speed	266MHz
Co-Processors/DSP	-
RAM Controllers	DDR
Graphics Acceleration	No
Display & Interface Controllers	-
Ethernet	10/100Mbps (1)
SATA	-
USB	-
Voltage - I/O	3.3V
Operating Temperature	0°C ~ 70°C (TA)
Security Features	-
Package / Case	256-LBGA
Supplier Device Package	256-CABGA (17x17)
Purchase URL	https://www.e-xfl.com/product-detail/renesas-electronics-america/79rc32h435-266bc

Pin Description Table

The following table lists the functions of the pins provided on the RC32435. Some of the functions listed may be multiplexed onto the same pin.

The active polarity of a signal is defined using a suffix. Signals ending with an “N” are defined as being active, or asserted, when at a logic zero (low) level. All other signals (including clocks, buses, and select lines) will be interpreted as being active, or asserted, when at a logic one (high) level.

Signal	Type	Name/Description
Memory and Peripheral Bus		
BDIRN	O	**External Buffer Direction.** Controls the direction of the external data bus buffer for the memory and peripheral bus. If the RC32435 memory and peripheral bus is connected to the A side of a transceiver, such as an IDT74FCT245, then this pin may be directly connected to the direction control (e.g., BDIR) pin of the transceiver.
BOEN	O	**External Buffer Enable.** This signal provides an output enable control for an external buffer on the memory and peripheral data bus.
WEN	O	**Write Enables.** This signal is the memory and peripheral bus write enable signal.
CSN[3:0]	O	**Chip Selects.** These signals are used to select an external device on the memory and peripheral bus.
MADDR[21:0]	O	**Address Bus.** 22-bit memory and peripheral bus address bus. MADDR[25:22] are available as GPIO alternate functions.
MDATA[7:0]	I/O	**Data Bus.** 8-bit memory and peripheral data bus. During a cold reset, these pins function as inputs that are used to load the boot configuration vector.
OEN	O	**Output Enable.** This signal is asserted when data should be driven by an external device on the memory and peripheral bus.
RWN	O	**Read Write.** This signal indicates whether the transaction on the memory and peripheral bus is a read transaction or a write transaction. A high level indicates a read from an external device. A low level indicates a write to an external device.
WAITACKN	I	**Wait or Transfer Acknowledge.** When configured as wait, this signal is asserted during a memory and peripheral bus transaction to extend the bus cycle. When configured as a transfer acknowledge, this signal is asserted during a transaction to signal the completion of the transaction.
DDR Bus		
DDRADDR[13:0]	O	**DDR Address Bus.** 14-bit multiplexed DDR address bus. This bus is used to transfer the addresses to the DDR devices.
DDRBA[1:0]	O	**DDR Bank Address.** These signals are used to transfer the bank address to the DDRs.
DDRCASN	O	**DDR Column Address Strobe.** This signal is asserted during DDR transactions.
DDRCKE	O	**DDR Clock Enable.** The DDR clock enable signal is asserted during normal DDR operation. This signal is negated following a cold reset or during a power down operation.
DDRCKN	O	**DDR Negative DDR clock.** This signal is the negative clock of the differential DDR clock pair.

Table 1 Pin Description (Part 1 of 6)

Signal	Type	Name/Description
GPIO[4]	I/O	**General Purpose I/O.** This pin can be configured as a general purpose I/O pin. Alternate function pin name: MADDR[22] Alternate function: Memory and peripheral bus address.
GPIO[5]	I/O	**General Purpose I/O.** This pin can be configured as a general purpose I/O pin. Alternate function pin name: MADDR[23] Alternate function: Memory and peripheral bus address.
GPIO[6]	I/O	**General Purpose I/O.** This pin can be configured as a general purpose I/O pin. Alternate function pin name: MADDR[24] Alternate function: Memory and peripheral bus address. The value of this pin may be used as a counter timer clock input (see Counter Timer Clock Select Register in Chapter 14, Counter/Timers, of the RC32435 User Manual).
GPIO[7]	I/O	**General Purpose I/O.** This pin can be configured as a general purpose I/O pin. Alternate function pin name: MADDR[25] Alternate function: Memory and peripheral bus address. The value of this pin may be used as a counter timer clock input (see Counter Timer Clock Select Register in Chapter 14, Counter/Timers, of the RC32435 User Manual).
GPIO[8]	I/O	**General Purpose I/O.** This pin can be configured as a general purpose I/O pin. Alternate function pin name: CPU Alternate function: CPU or DMA debug output pin.
GPIO[9]	I/O	**General Purpose I/O.** This pin can be configured as a general purpose I/O pin. Alternate function pin name: PCIREQN[4] Alternate function: PCI Request 4.
GPIO[10]	I/O	**General Purpose I/O.** This pin can be configured as a general purpose I/O pin. Alternate function pin name: PCIGNTN[4] Alternate function: PCI Grant 4.
GPIO[11]	I/O	**General Purpose I/O.** This pin can be configured as a general purpose I/O pin. Alternate function pin name: PCIREQN[5] Alternate function: PCI Request 5.
GPIO[12]	I/O	**General Purpose I/O.** This pin can be configured as a general purpose I/O pin. Alternate function pin name: PCIGNTN[5] Alternate function: PCI Grant 5.
GPIO[13]	I/O	**General Purpose I/O.** This pin can be configured as a general purpose I/O pin. Alternate function pin name: PCIMUINTN Alternate function: PCI Messaging unit interrupt output.
SPI Interface		
SCK	I/O	**Serial Clock**. This signal is used as the serial clock output. This pin may be used as a bit input/output port.

Table 1 Pin Description (Part 4 of 6)

Signal	Type	Name/Description
EJTAG_TMS	I	**EJTAG Mode**. The value on this signal controls the test mode select of the EJTAG Controller. When using the JTAG boundary scan, this pin should be left disconnected (since there is an internal pull-up) or driven high.
JTAG_TRST_N	I	**JTAG Reset**. This active low signal asynchronously resets the boundary scan logic, JTAG TAP Controller, and the EJTAG Debug TAP Controller. An external pull-up on the board is recommended to meet the JTAG specification in cases where the tester can access this signal. However, for systems running in functional mode, one of the following should occur: 1) actively drive this signal low with control logic 2) statically drive this signal low with an external pull-down on the board 3) clock JTAG_TCK while holding EJTAG_TMS and/or JTAG_TMS high.
JTAG_TCK	I	**JTAG Clock**. This is an input test clock used to clock the shifting of data into or out of the boundary scan logic, JTAG Controller, or the EJTAG Controller. JTAG_TCK is independent of the system and the processor clock with a nominal 50% duty cycle.
JTAG_TDO	O	**JTAG Data Output**. This is the serial data shifted out from the boundary scan logic, JTAG Controller, or the EJTAG Controller. When no data is being shifted out, this signal is tri-stated.
JTAG_TDI	I	**JTAG Data Input**. This is the serial data input to the boundary scan logic, JTAG Controller, or the EJTAG Controller.
System		
CLK	I	**Master Clock.** This is the master clock input. The processor frequency is a multiple of this clock frequency. This clock is used as the system clock for all memory and peripheral bus operations.
EXTBCV	I	**Load External Boot Configuration Vector.** When this pin is asserted (i.e., high) the boot configuration vector is loaded from an externally supplied value during a cold reset. When this pin is negated, the boot configuration vector is taken from the NVRAM located on-chip.
EXTCLK	O	**External Clock.** This clock is used for all memory and peripheral bus operations.
COLDRSTN	I	**Cold Reset.** The assertion of this signal initiates a cold reset. This causes the processor state to be initialized, boot configuration to be loaded, and the internal PLL to lock onto the master clock (CLK).
RSTN	I/O	**Reset.** The assertion of this bidirectional signal initiates a warm reset. This signal is asserted by the RC32435 during a warm reset.

Table 1 Pin Description (Part 6 of 6)

Boot Configuration Vector

The encoding of the boot configuration vector is described in Table 3, and the vector input is illustrated in Figure 4. The value of the boot configuration vector read in by the RC32435 during a cold reset may be determined by reading the Boot Configuration Vector (BCV) Register.

Signal	Name/Description
MADDR[3:0]	**CPU Pipeline Clock Multiplier**. This field specifies the value by which the PLL multiplies the master clock input (CLK) to obtain the processor clock frequency (PCLK). For master clock input frequency constraints, refer to Table 3.2 in the RC32435 User Manual. 0x0 - PLL Bypass 0x1 - Multiply by 3 0x2 - Multiply by 4 0x3 - Multiply by 5 - Reserved 0x4 - Multiply by 5 0x5 - Multiply by 6 - Reserved 0x6 - Multiply by 6 0x7 - Multiply by 8 0x8 - Multiply by 10 0x9 through 0xF - Reserved
MADDR[5:4]	**External Clock Divider**. This field specifies the value by which the IPBus clock (ICLK), which is always 1/2 PCLK, is divided in order to generate the external clock output on the EXTCLK pin. 0x0 - Divide by 1 0x1 - Divide by 2 0x2 - Divide by 4 0x3 - reserved
MADDR[6]	**Endian.** This bit specifies the endianness. 0x0 - little endian 0x1 - big endian
MADDR[7]	**Reset Mode**. This bit specifies the length of time the RSTN signal is driven. 0x0 - Normal reset: RSTN driven for minimum of 4000 clock cycles. If the internal boot configuration vector is selected, the expiration of an 18-bit counter operating at the master clock input (CLK) frequency is used as the PLL stabilization delay. 0x1 - Reserved
MADDR[10:8]	**PCI Mode**. This bit controls the operating mode of the PCI bus interface. The initial value of the EN bit in the PCIC register is determined by the PCI mode. 0x0 - Disabled (EN initial value is zero) 0x1 - PCI satellite mode with PCI target not ready (EN initial value is one) 0x2 - PCI satellite mode with suspended CPU execution (EN initial value is one) 0x3 - PCI host mode with external arbiter (EN initial value is zero) 0x4 - PCI host mode with internal arbiter using fixed priority arbitration algorithm (EN initial value is zero) 0x5 - PCI host mode with internal arbiter using round robin arbitration algorithm (EN initial value is zero) 0x6 - *reserved* 0x7 - *reserved*

Table 3 Boot Configuration Encoding (Part 1 of 2)

System Clock Parameters

(Values based on systems running at recommended supply voltages and operating temperatures, as shown in Tables 15 and 16.)

Parameter	Symbol	Reference Edge	266MHz		300MHz		350MHz		400MHz		Units	Timing Diagram Reference
			Min	Max	Min	Max	Min	Max	Min	Max		
PCLK[1]	Frequency	none	200	266	200	300	200	350	200	400	MHz	See Figure 3.
	Tper		3.8	5.0	3.3	5.0	2.85	5.0	2.5	5.0	ns	
ICLK[2,3,4]	Frequency	none	100	133	100	150	100	175	100	200	MHz	
	Tper		7.5	10.0	6.7	10.0	5.7	10.0	5.0	10.0	ns	
CLK[5]	Frequency	none	25	125	25	125	25	125	25	125	MHz	
	Tper_5a		8.0	40.0	8.0	40.0	8.0	40.0	8.0	40.0	ns	
	Thigh_5a, Tlow_5a		40	60	40	60	40	60	40	60	% of Tper_5a	
	Trise_5a, Tfall_5a		—	3.0	—	3.0	—	3.0	—	3.0	ns	
	Tjitter_5a		—	0.1	—	0.1	—	0.1	—	0.1	ns	

Table 5 Clock Parameters

1. The CPU pipeline clock (PCLK) speed is selected during cold reset by the boot configuration vector (see Table 3). Refer to Chapter 3, Clocking and Initialization, in the RC32435 User Reference Manual for the allowable frequency ranges of CLK and PCLK.
2. ICLK is the internal IPBus clock. It is always equal to PCLK divided by 2. This clock cannot be sampled externally.
3. The ethernet clock (MIIxRXCLK and MIIxTXCLK) frequency must be equal to or less than 1/2 ICLK (MIIxRXCLK and MIIxTXCLK <= 1/2(ICLK)).
4. PCICLK must be equal to or less than two times ICLK (PCICLK <= 2(ICLK)) with a maximum PCICLK of 66 MHz.
5. The input clock (CLK) is input from the external oscillator to the internal PLL.

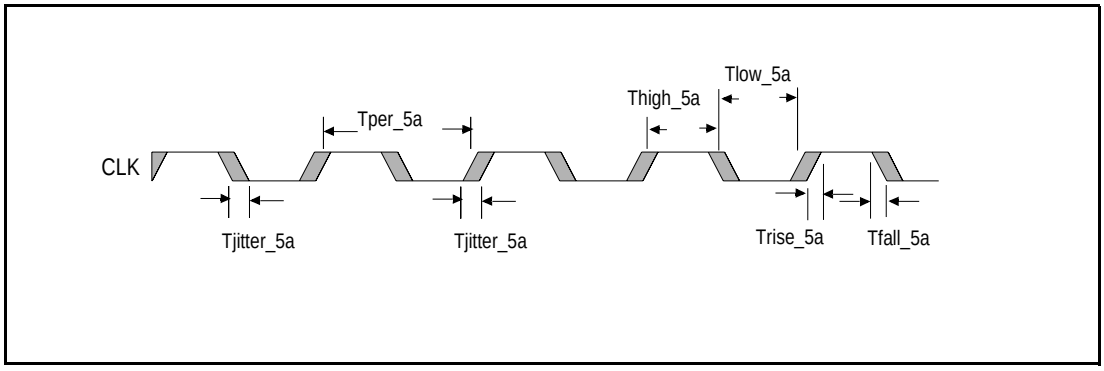

Figure 3 Clock Parameters Waveform

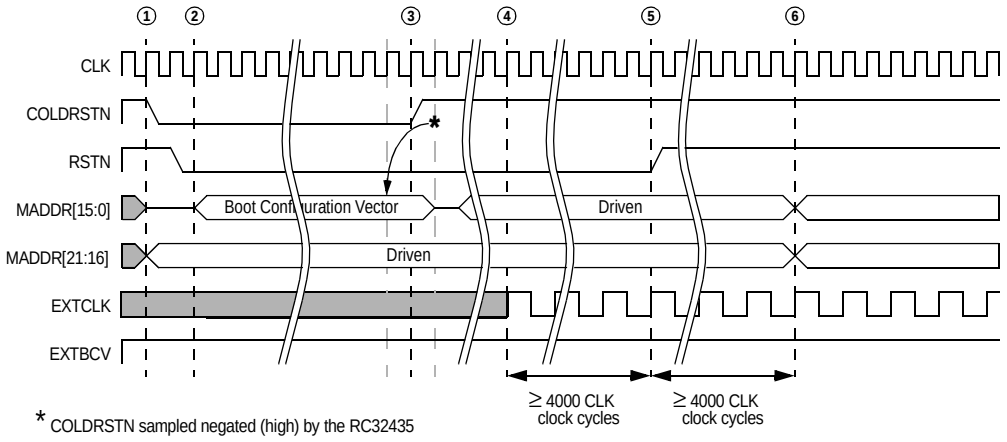
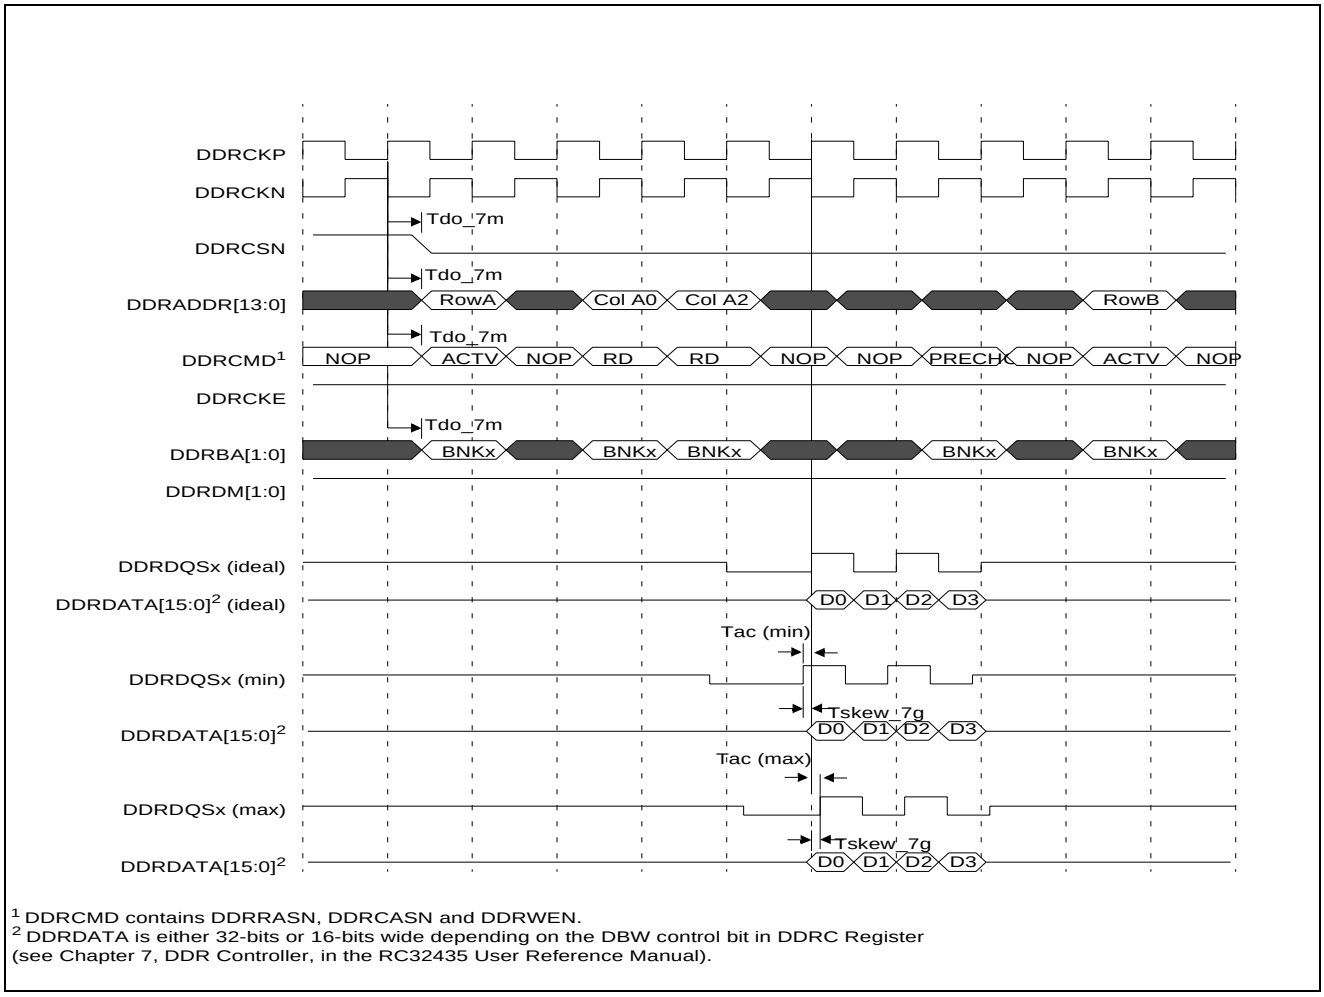


1. EXTBCV is asserted (i.e., pulled-up). COLDRSTN is asserted by external logic. The RC32435 responds by immediately tri-stating the bottom 16-bits of the memory and peripheral address bus (MADDR[15:0]), driving the remaining address bus signals (i.e., MADDR[21:16]), and asserting RSTN. EXTCLK is undefined at this point.
2. External logic drives the boot configuration vector on MADDR[15:0].
3. External logic negates COLDRSTN and tri-states the boot configuration vector on MADDR[15:0]. In response, the RC32435 stops sampling the boot configuration vector and retains the boot configuration vector value seen two clock cycles earlier (i.e., the value on the MADDR[15:0] lines two rising edges of CLK earlier). Within 16 CLK clock cycles after COLDRSTN is sampled negated, the RC32435 begins driving MADDR[15:0].
4. The RC32435 waits for the NVRAM to initialize (if the Disable NVRAM Initialization mode is not selected in the boot configuration vector) and for the PLL to stabilize.
5. The RC32435 then begins generating EXTCLK.
6. After at least 4000 CLK clock cycles, the RC32435 tri-states RSTN.
7. At least 4000 CLK clock cycles after negating RSTN, the RC32435 samples RSTN. If RSTN is negated, cold reset has completed and the RC32435 CPU begins executing by taking MIPS reset exception.

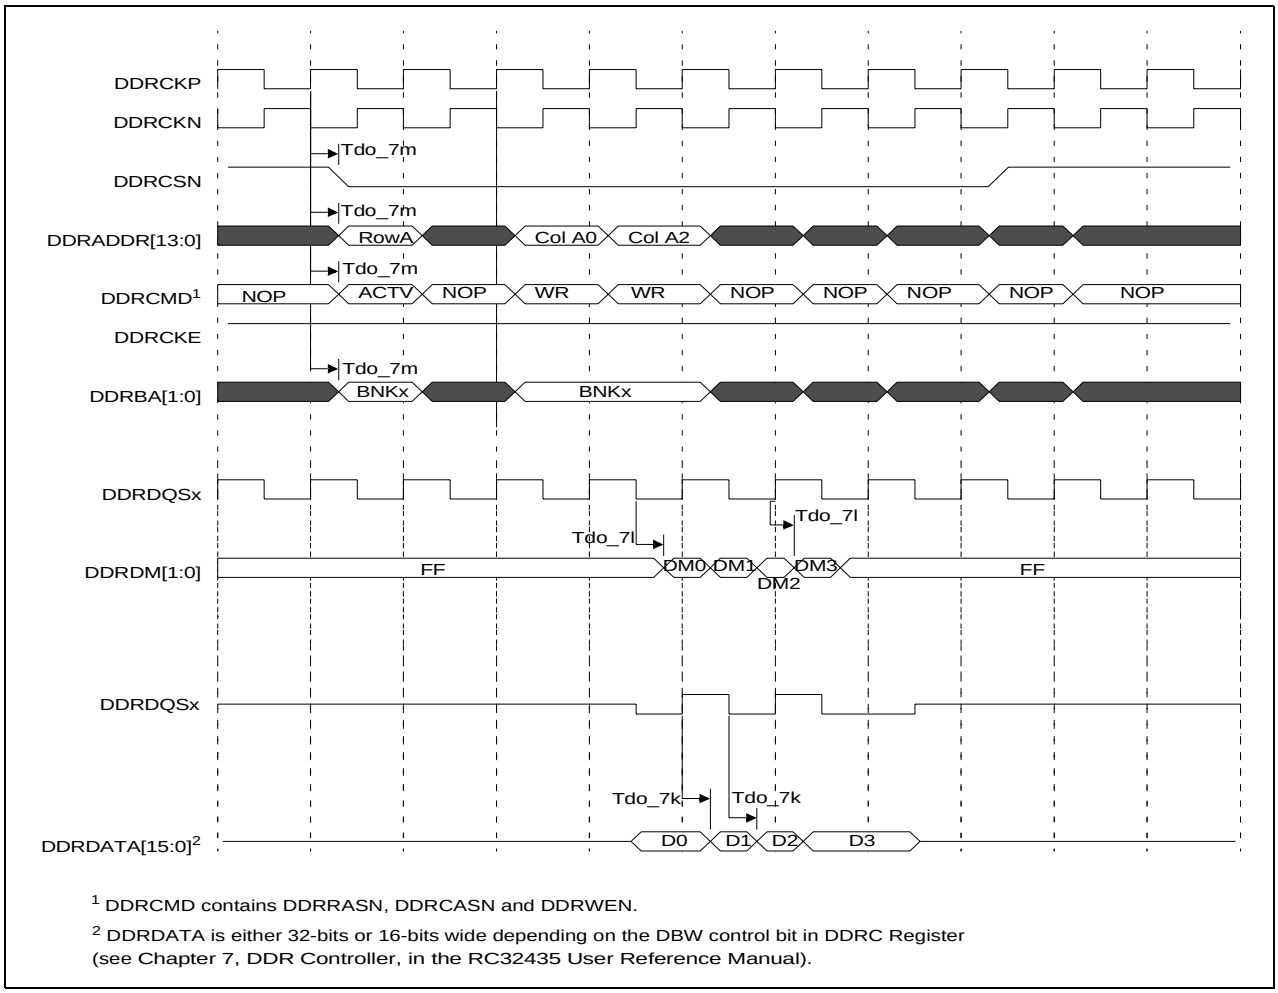
Figure 4 COLD Reset Operation with External Boot Configuration Vector AC Timing Waveform

Note: For a diagram showing the COLD Reset Operation with Internal Boot Configuration Vector, see Figure 3.6 in the RC32435 User Reference Manual.



[1] DDRCMD contains DDRRASN, DDRCASN and DDRWEN.
[2] DDRDATA is either 32-bits or 16-bits wide depending on the DBW control bit in DDRC Register (see Chapter 7, DDR Controller, in the RC32435 User Reference Manual).

Figure 6 DDR SDRAM AC Timing Waveform - SDRAM Read Access



[1] DDRCMD contains DDRRASN, DDRCASN and DDRWEN.

[2] DDRDATA is either 32-bits or 16-bits wide depending on the DBW control bit in DDRC Register (see Chapter 7, DDR Controller, in the RC32435 User Reference Manual).

Table 8 Memory and Peripheral Bus AC Timing Characteristics (Part 2 of 2)

1. The RC32435 provides bus turnaround cycles to prevent bus contention when going from read to write, write to read, and during external bus ownership. For example, there are no cycles where an external device and the RC32435 are both driving. See Chapter 6, Device Controller, in the RC32435 User Reference Manual.

2. The values for this symbol were determined by calculation, not by testing.

3. The frequency of EXTCLK is programmable. See the External Clock Divider (MDATA[5:4]) description in Table 3 of this data sheet.

4. WAITACKN must meet the setup and hold times if it is synchronous or the minimum pulse width if it is asynchronous.

Start or repeated start condition	Tsu_12c	SDA falling	0.6	—	0.6	—	0.6	—	0.6	—	µs	400 KHz	See Figure 14.
	Thld_12c		0.6	—	0.6	—	0.6	—	0.6	—	µs		
Stop condition	Tsu_12d	SDA rising	0.6	—	0.6	—	0.6	—	0.6	—	µs		
Bus free time between a stop and start condition	Tdelay_12e		1.3	—	1.3	—	1.3	—	1.3	—	µs		

Table 11 I²C AC Timing Characteristics (Part 2 of 2)

1. For more information, see the I²C-Bus specification by Philips Semiconductor.

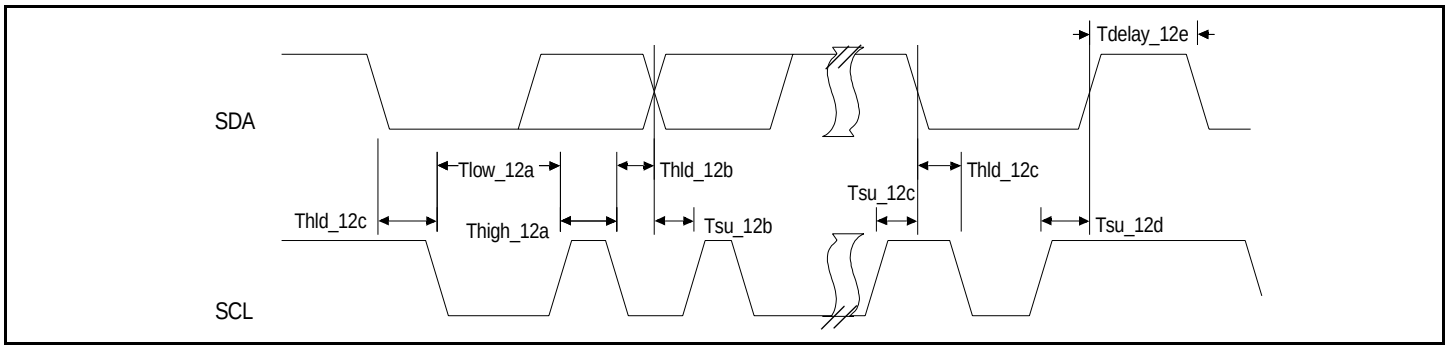

Figure 14 I2C AC Timing Waveform

Signal	Symbol	Reference Edge	266MHz		300MHz		350MHz		400MHz		Unit	Conditions	Timing Diagram Reference
			Min	Max	Min	Max	Min	Max	Min	Max			
GPIO													
GPIO[13:0]	Tpw_13b[1]	None	2(ICLK)	—	2(ICLK)	—	2(ICLK)	—	2(ICLK)	—	ns		See Figure 15.

Table 12 GPIO AC Timing Characteristics

1. The values for this symbol were determined by calculation, not by testing.

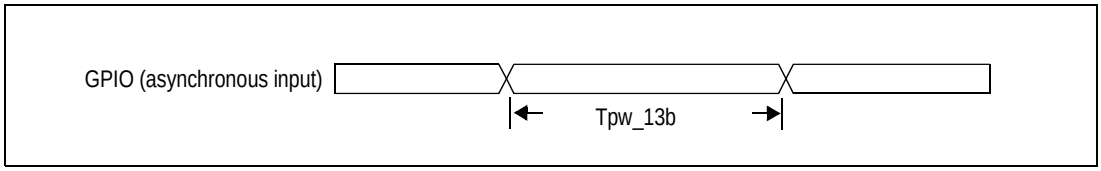

Figure 15 GPIO AC Timing Waveform

Using the EJTAG Probe

In Figure 20, the pull-up resistors for JTAG_TDO and RST*, the pull-down resistor for JTAG_TRST_N, and the series resistor for JTAG_TDO must be adjusted to the specific design. However, the recommended pull-up/down resistor is 1.0 kΩ because a low value reduces crosstalk on the cable to the connector, allowing higher JTAG_TCK frequencies. A typical value for the series resistor is 33 Ω. Recommended resistor values have ± 5% tolerance.

If a probe is used, the pull-up resistor on JTAG_TDO must ensure that the JTAG_TDO level is high when no probe is connected and the JTAG_TDO output is tri-stated. This requirement allows reliable connection of the probe if it is hooked-up when the power is already on (hot plug). The pull-up resistor value of around 47 kΩ should be sufficient. Optional diodes to protect against overshoot and undershoot voltage can be added on the signals of the chip with EJTAG.

If a probe is used, the RST* signal must have a pull-up resistor because it is controlled by an open-collector (OC) driver in the probe, and thus is actively pulled low only. The pull-up resistor is responsible for the high value when not driven by the probe of 25pF. The input on the target system reset circuit must be able to accept the rise time when the pull-up resistor charges the capacitance to a high logical level. Vcc I/O must connect to a voltage reference that drops rapidly to below 0.5V when the target system loses power, even with a capacitive load of 25pF. The probe can thus detect the lost power condition.

For additional information on EJTAG, refer to Chapter 17 of the RC32435 User Reference Manual.

Phase-Locked Loop (PLL)

The phase-locked loop (PLL) multiplies the external oscillator input (pin CLK) according to the parameter provided by the boot configuration vector to create the processor clock (PCLK). Inherently, PLL circuits are only capable of generating clock frequencies within a limited range.

PLL Filters

It is recommended that the system designer provide a filter network of passive components for the PLL analog and digital power supplies. The PLL circuit power and PLL circuit ground should be isolated from power and ground with a filter circuit such as the one shown in Figure 21. Because the optimum values for the filter components depend upon the application and the system noise environment, these values should be considered as starting points for further experimentation within your specific application.

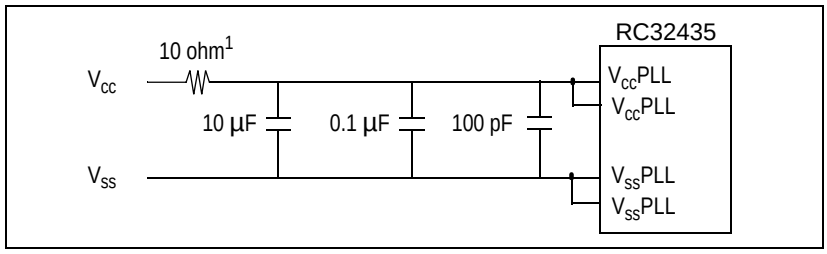

Figure 21 PLL Filter Circuit for Noisy Environments

Recommended Operating Supply Voltages

Symbol	Parameter	Minimum	Typical	Maximum	Unit
V_{SS}	Common ground	0	0	0	V
V_{SS}PLL	PLL ground				
V_{CC}I/O	I/O supply except for SSTL_2[1]	3.135	3.3	3.465	V
V_{CC}SI/O (DDR)	I/O supply for SSTL_2[1]	2.375	2.5	2.625	V
V_{CC}PLL	PLL supply (digital)	1.1	1.2	1.3	V
V_{CC}APLL	PLL supply (analog)	3.135	3.3	3.465	V
V_{CC}Core	Internal logic supply	1.1	1.2	1.3	V
DDRVREF[2]	SSTL_2 input reference voltage	0.5(VccSI/O)	0.5(VccSI/O)	0.5(VccSI/O)	V
V_{TT}[3]	SSTL_2 termination voltage	DDRVREF - 0.04	DDRVREF	DDRVREF + 0.04	V

Table 15 RC32435 Operating Voltages

1. SSTL_2 I/Os are used to connect to DDR SDRAM.
2. Peak-to-peak AC noise on DDRVREF may not exceed ± 2% DDRVREF (DC).
3. V_{TT} of the SSTL_2 transmitting device must track DDRVREF of the receiving device.

Recommended Operating Temperatures

Grade	Temperature
Commercial	0°C to +70°C Ambient
Industrial	-40°C to +85°C Ambient

Table 16 RC32435 Operating Temperatures

Capacitive Load Deration

Refer to the 79RC32435 IBIS Model on the IDT web site (www.idt.com).

Package Pin-out — 256-BGA Signal Pinout for the RC32435

The following table lists the pin numbers, signal names, and number of alternate functions for the RC32435 device. Signal names ending with an "_n" or "n" are active when low.

Pin	Function	Alt	Pin	Function	Alt	Pin	Function	Alt	Pin	Function	Alt
A1	RWN		E1	MIIRXD[3]		J1	GPIO[3]	1	N1	PCIAD[29]
