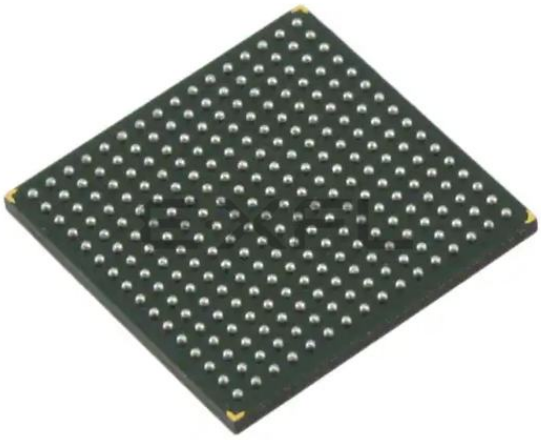
Renesas Electronics America Inc - 79RC32H435-350BCG Datasheet



Welcome to E-XFL.COM

Understanding Embedded - Microprocessors

Embedded microprocessors are specialized computing chips designed to perform specific tasks within an embedded system. Unlike general-purpose microprocessors found in personal computers, embedded microprocessors are tailored for dedicated functions within larger systems, offering optimized performance, efficiency, and reliability. These microprocessors are integral to the operation of countless electronic devices, providing the computational power necessary for controlling processes, handling data, and managing communications.

Applications of Embedded - Microprocessors

Embedded microprocessors are utilized across a broad spectrum of applications, making them indispensable in

Details	
Product Status	Obsolete
Core Processor	MIPS32
Number of Cores/Bus Width	1 Core, 32-Bit
Speed	350MHz
Co-Processors/DSP	-
RAM Controllers	DDR
Graphics Acceleration	No
Display & Interface Controllers	-
Ethernet	10/100Mbps (1)
SATA	-
USB	-
Voltage - I/O	3.3V
Operating Temperature	0°C ~ 70°C (TA)
Security Features	-
Package / Case	256-LBGA
Supplier Device Package	256-CABGA (17x17)
Purchase URL	https://www.e-xfl.com/product-detail/renesas-electronics-america/79rc32h435-350bcg

- **Non-Volatile RAM**
  - *Provides 512-bits of non-volatile storage*
  - *Eliminates need for external boot configuration vector*
  - *Stores initial PCI configuration register values when PCI configured to operate in satellite mode with suspended CPU execution*
  - *Authorization unit ensures only authorized software will operate on the system*
- **Memory and Peripheral Device Controller**
  - *Provides "glueless" interface to standard SRAM, Flash, ROM, dual-port memory, and peripheral devices*
  - *Demultiplexed address and data buses: 8-bit data bus, 26-bit address bus, 4 chip selects, control for external data bus buffers*

    Automatic byte gathering and scattering
  - *Flexible protocol configuration parameters: programmable number of wait states (0 to 63), programmable postread/post-write delay (0 to 31), supports external wait state generation, supports Intel and Motorola style peripherals*
  - *Write protect capability per chip select*
  - *Programmable bus transaction timer generates warm reset when counter expires*
  - *Supports up to 64 MB of memory per chip select*
- **DMA Controller**
  - *6 DMA channels: two channels for PCI (PCI to Memory and Memory to PCI), two channels for the Ethernet interface, and two channels for memory to memory DMA operations*
  - *Provides flexible descriptor based operation*
  - *Supports unaligned transfers (i.e., source or destination address may be on any byte boundary) with arbitrary byte length*
- **Universal Asynchronous Receiver Transmitter (UART)**
  - *Compatible with the 16550 and 16450 UARTs*
  - *16-byte transmit and receive buffers*
  - *Programmable baud rate generator derived from the system clock*
  - *Fully programmable serial characteristics:*
    - *5, 6, 7, or 8 bit characters*
    - *Even, odd or no parity bit generation and detection*
    - *1, 1-1/2 or 2 stop bit generation*
  - *Line break generation and detection*
  - *False start bit detection*
  - *Internal loopback mode*
- **I^2C-Bus**
  - *Supports standard 100 Kbps mode as well as 400 Kbps fast mode*
  - *Supports 7-bit and 10-bit addressing*
  - *Supports four modes: master transmitter, master receiver, slave transmitter, slave receiver*
- **Additional General Purpose Peripherals**
  - *Interrupt controller*
  - *System integrity functions*
  - *General purpose I/O controller*
  - *Serial peripheral interface (SPI)*
- **Counter/Timers**
  - *Three general purpose 32-bit counter timers*
  - *Timers may be cascaded*
  - *Selectable counter/timer clock source*
- **JTAG Interface**
  - *Compatible with IEEE Std. 1149.1 - 1990*

CPU Execution Core

The 32-bit CPU core is 100% compatible with the MIPS32 instruction set architecture (ISA). Specifically, this device features the 4Kc CPU core developed by MIPS Technologies Inc. (www.mips.com). This core issues a single instruction per cycle, includes a five stage pipeline and is optimized for applications that require integer arithmetic.

The CPU core includes 8 KB instruction and 8 KB data caches. Both caches are 4-way set associative and can be locked on a per line basis, which allows the programmer control over this precious on-chip memory resource. The core also features a memory management unit (MMU). The CPU core also incorporates an enhanced joint test access group (EJTAG) interface that is used to interface to in-circuit emulator tools, providing access to internal registers and enabling the part to be controlled externally, simplifying the system debug process.

The use of this core allows IDT's customers to leverage the broad range of software and development tools available for the MIPS architecture, including operating systems, compilers, and in-circuit emulators.

PCI Interface

The PCI interface on the RC32435 is compatible with version 2.2 of the PCI specification. An on-chip arbiter supports up to six external bus masters, supporting both fixed priority and rotating priority arbitration schemes. The part can support both satellite and host PCI configurations, enabling the RC32435 to act as a slave controller for a PCI add-in card application or as the primary PCI controller in the system. The PCI interface can be operated synchronously or asynchronously to the other I/O interfaces on the RC32435 device.

Ethernet Interface

The RC32435 has one Ethernet Channel supporting 10Mbps and 100Mbps speeds to provide a standard media independent interface (MII or RMII), allowing a wide range of external devices to be connected efficiently.

Double Data Rate Memory Controller

The RC32435 incorporates a high performance double data rate (DDR) memory controller which supports x16 memory configurations up to 256MB. This module provides all of the signals required to interface to discrete memory devices, including a chip select, differential clocking outputs and data strobes.

Memory and I/O Controller

The RC32435 uses a dedicated local memory/IO controller including a de-multiplexed 8-bit data and 26-bit address bus. It includes all of the signals required to interface directly to a maximum of four Intel or Motorola-style external peripherals.

DMA Controller

The DMA controller consists of 6 independent DMA channels, all of which operate in exactly the same manner. The DMA controller off-loads the CPU core from moving data among the on-chip interfaces, external peripherals, and memory. The controller supports scatter/gather DMA with no alignment restrictions, making it appropriate for communications and graphics systems.

UART Interface

The RC32435 contains a serial channel (UART) that is compatible with the industry standard 16550 UART.

I^2C Interface

The standard I2C interface allows the RC32435 to connect to a number of standard external peripherals for a more complete system solution. The RC32435 supports both master and slave operations.

General Purpose I/O Controller

The RC32435 has 14 general purpose input/output pins. Each pin may be used as an active high or active low level interrupt or non-maskable interrupt input, and each signal may be used as a bit input or output port.

System Integrity Functions

The RC32435 contains a programmable watchdog timer that generates a non-maskable interrupt (NMI) when the counter expires and also contains an address space monitor that reports errors in response to accesses to undecoded address regions.

Thermal Considerations

The RC32435 is guaranteed in an ambient temperature range of 0° to +70° C for commercial temperature devices and - 40° to +85° for industrial temperature devices.

Revision History

January 19, 2006: Initial publication.

Signal	Type	Name/Description
PCILOCKN	I/O	**PCI Lock**. This signal is asserted by an external bus master to indicate that an exclusive operation is occurring.
PCIPAR	I/O	**PCI Parity**. Even parity of the PCIAD[31:0] bus. Driven by the bus master during address and write Data phases. Driven by the bus target during the read data phase.
PCIPERRN	I/O	**PCI Parity Error**. If a parity error is detected, this signal is asserted by the receiving bus agent 2 clocks after the data is received.
PCIREQN[3:0]	I/O	**PCI Bus Request.** **In PCI host mode with internal arbiter:** These signals are inputs whose assertion indicates to the internal RC32435 arbiter that an agent desires ownership of the PCI bus. **In PCI host mode with external arbiter:** PCIREQN[0]: asserted by the RC32435 to request ownership of the PCI bus. PCIREQN[3:1]: unused and driven high. **In PCI satellite mode:** PCIREQN[0]: this signal is asserted by the RC32435 to request use of the PCI bus. PCIREQN[1]: function changes to PCIIDSEL and is used as a chip select during configuration read and write transactions. PCIREQN[3:2]: unused and driven high.
PCIRSTN	I/O	**PCI Reset**. In host mode, this signal is asserted by the RC32435 to generate a PCI reset. In satellite mode, assertion of this signal initiates a warm reset.
PCISERRN	I/O	**PCI System Error**. This signal is driven by an agent to indicate an address parity error, data parity error during a special cycle command, or any other system error. Requires an external pull-up.
PCISTOPN	I/O	**PCI Stop**. Driven by the bus target to terminate the current bus transaction. For example, to indicate a retry.
PCITRDYN	I/O	**PCI Target Ready**. Driven by the bus target to indicate that the current data can complete.
General Purpose Input/Output		
GPIO[0]	I/O	**General Purpose I/O.** This pin can be configured as a general purpose I/O pin. Alternate function pin name: U0SOUT Alternate function: UART channel 0 serial output.
GPIO[1]	I/O	**General Purpose I/O.** This pin can be configured as a general purpose I/O pin. Alternate function pin name: U0SINP Alternate function: UART channel 0 serial input.
GPIO[2]	I/O	**General Purpose I/O.** This pin can be configured as a general purpose I/O pin. Alternate function pin name: U0RTSN Alternate function: UART channel 0 request to send.
GPIO[3]	I/O	**General Purpose I/O.** This pin can be configured as a general purpose I/O pin. Alternate function pin name: U0CTSN Alternate function: UART channel 0 clear to send.

Table 1 Pin Description (Part 3 of 6)

Pin Characteristics

Note: Some input pads of the RC32435 do not contain internal pull-ups or pull-downs. Unused inputs should be tied off to appropriate levels. This is especially critical for unused control signal inputs (such as WAITACKN) which, if left floating, could adversely affect the RC32435's operation. Also, any input pin left floating can cause a slight increase in power consumption.

Function	Pin Name	Type	Buffer	I/O Type	Internal Resistor	Notes[1]
Memory and Peripheral Bus	BDIRN	O	LVTTL	High Drive		
	BOEN	O	LVTTL	High Drive

	GPIO[13:9]	I/O	PCI			pull-up on board

Table 2 Pin Characteristics (Part 1 of 2)

Signal	Name/Description
MADDR[11]	**Disable Watchdog Timer**. When this bit is set, the watchdog timer is disabled following a cold reset. 0x0 - Watchdog timer enabled 0x1 - Watchdog timer disabled
MADDR[13:12]	**Reserved**. These pins must be driven low during boot configuration.
MADDR[15:14]	**Reserved**. Must be set to zero.

Table 3 Boot Configuration Encoding (Part 2 of 2)

Logic Diagram — RC32435

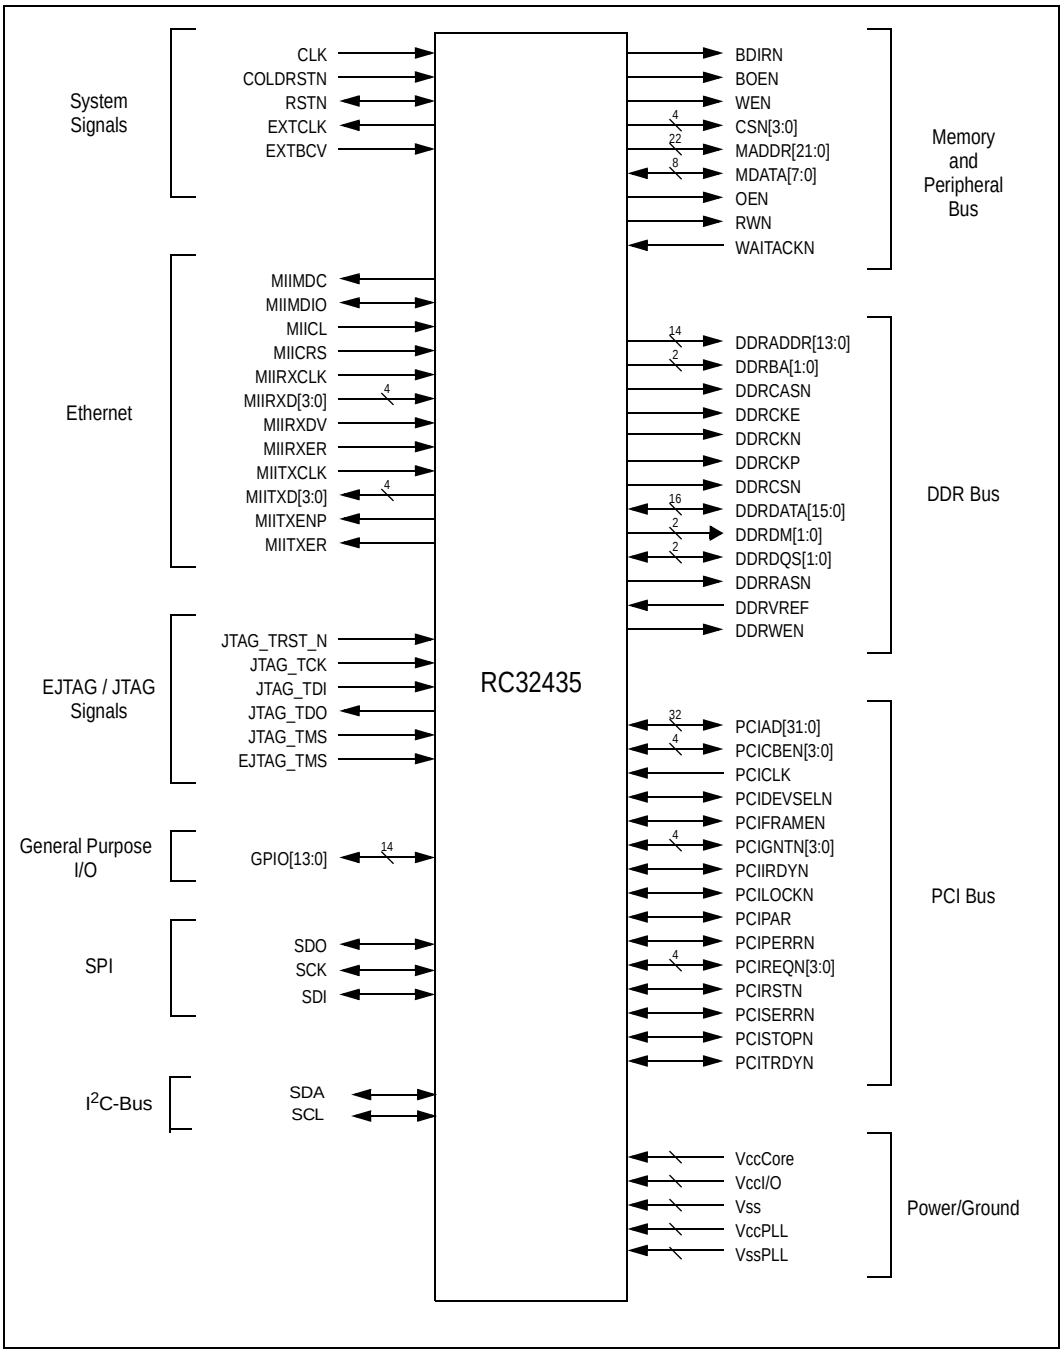

Figure 1 Logic Diagram

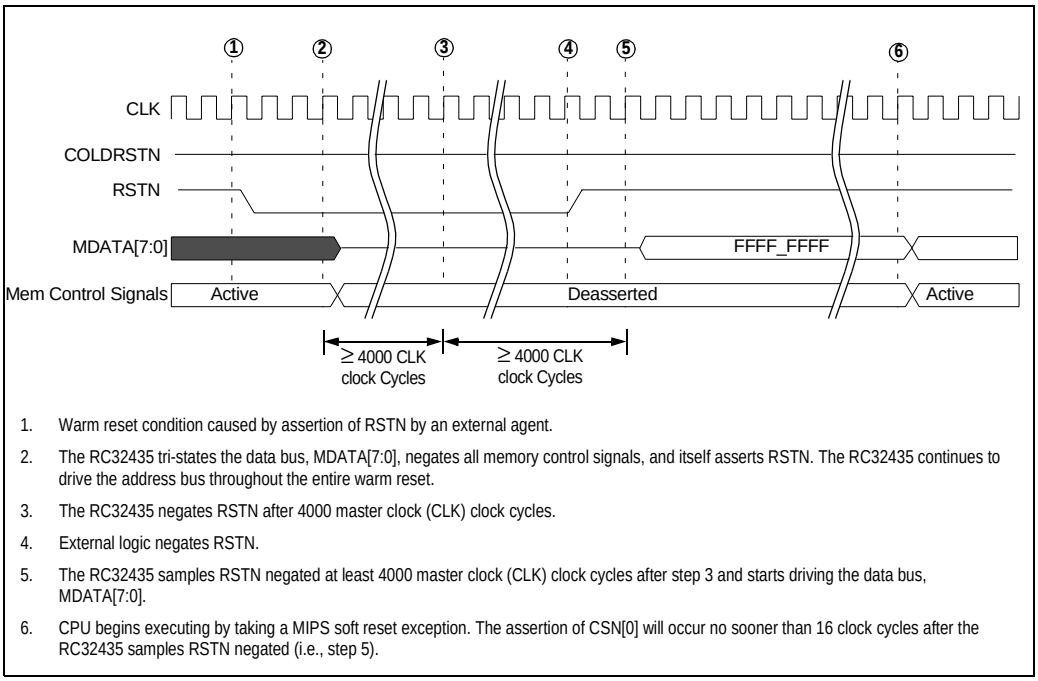

1. Warm reset condition caused by assertion of RSTN by an external agent.
2. The RC32435 tri-states the data bus, MDATA[7:0], negates all memory control signals, and itself asserts RSTN. The RC32435 continues to drive the address bus throughout the entire warm reset.
3. The RC32435 negates RSTN after 4000 master clock (CLK) clock cycles.
4. External logic negates RSTN.
5. The RC32435 samples RSTN negated at least 4000 master clock (CLK) clock cycles after step 3 and starts driving the data bus, MDATA[7:0].
6. CPU begins executing by taking a MIPS soft reset exception. The assertion of CSN[0] will occur no sooner than 16 clock cycles after the RC32435 samples RSTN negated (i.e., step 5).

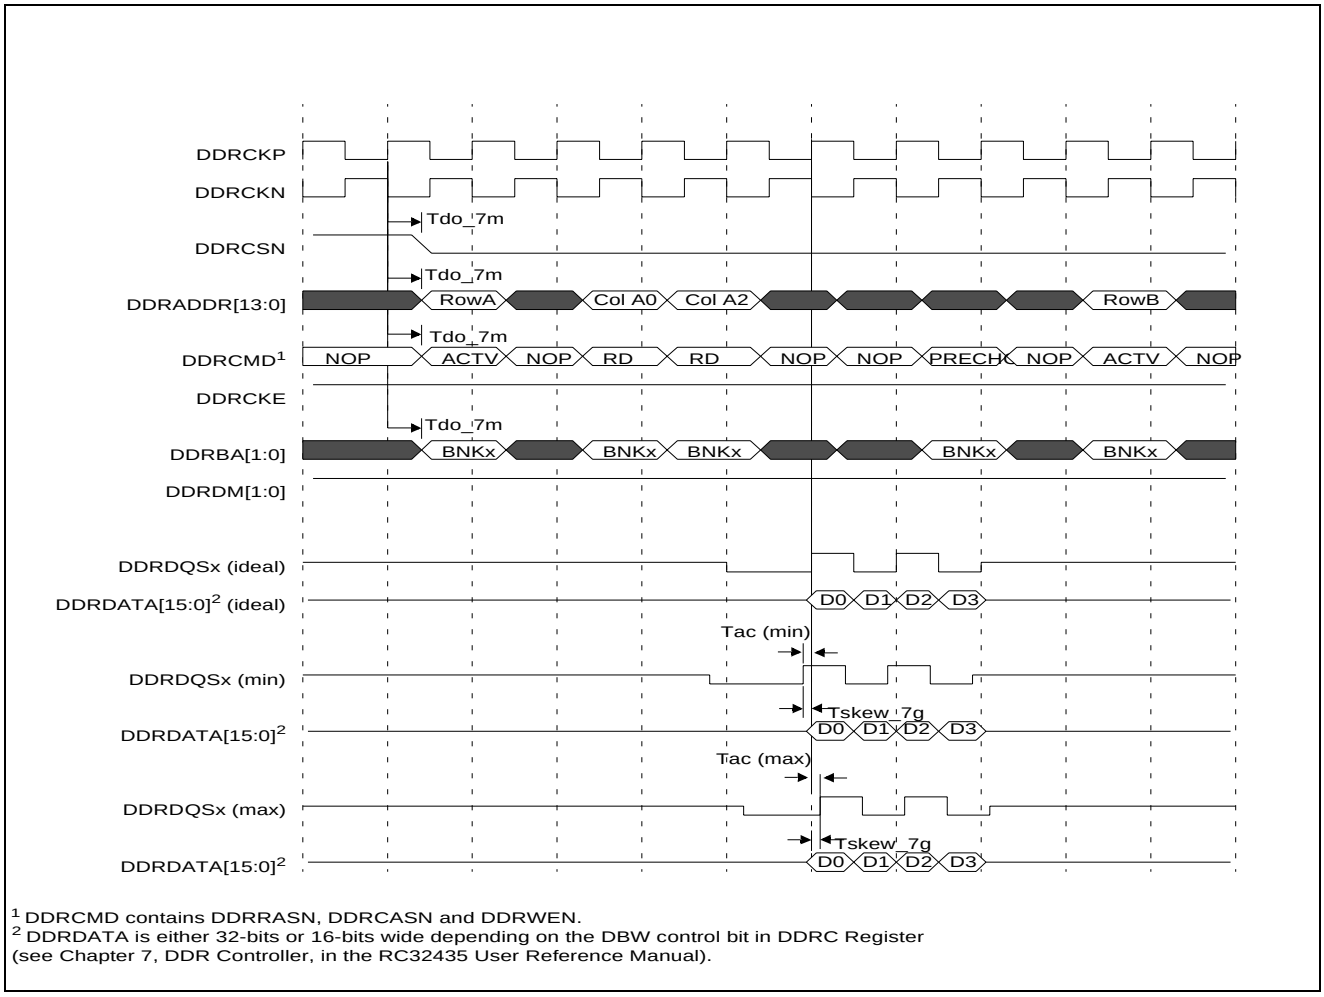
Table 7 DDR SDRAM Timing Characteristics

1. Meets DDR timing requirements for 150MHz clock rate DDR SDRAMs with 300 ps remaining margin to compensate for PCB propagation mismatches, which is adequate to guarantee functional timing, provided the RC32435 DDR layout guidelines are adhered to.

2. Setup times are calculated as applicable clock period - Tdo max. For example, if the DDR is running at 266MHz, it uses a 133MHz input clock. The period for a 133MHz clock is 7.5ns. If the Tdo max value is 4.6ns, the T_{IS} parameter is 7.5ns minus 4.6ns = 2.9ns. The DDR spec for this parameter is 1ns, so there is 1.9ns of slack left over for board propagation. Calculations for T_{DS} are similar, but since this parameter is taken relative to the DDRDQS signals, which are referenced on both edges, the effective period with a 133MHz input clock is only 3.75ns. So, if the max Tdo is 1.9ns, we have 3.75ns minus 1.9ns = 1.85ns for T_{DS}. The DDR data sheet specs a value of 0.5ns for 266MHz, so this leaves 1.35ns slack for board propagation delays.



[1] DDRCMD contains DDRRASN, DDRCASN and DDRWEN.
[2] DDRDATA is either 32-bits or 16-bits wide depending on the DBW control bit in DDRC Register (see Chapter 7, DDR Controller, in the RC32435 User Reference Manual).

	Thld_6e		1.0	—	1.0	—	1.0	—	1.0	—	ns		

Table 14 JTAG AC Timing Characteristics

1. The JTAG specification, IEEE 1149.1, recommends that both JTAG_TMS and EJTAG_TMS should be held at 1 while the signal applied at JTAG_TRST_N changes from 0 to 1. Otherwise, a race may occur if JTAG_TRST_N is deasserted (going from low to high) on a rising edge of JTAG_TCK when either JTAG_TMS or EJTAG_TMS is low, because the TAP controller might go to either the Run-Test/Idle state or stay in the Test-Logic-Reset state.

2. The values for this symbol were determined by calculation, not by testing.

Power-on Sequence

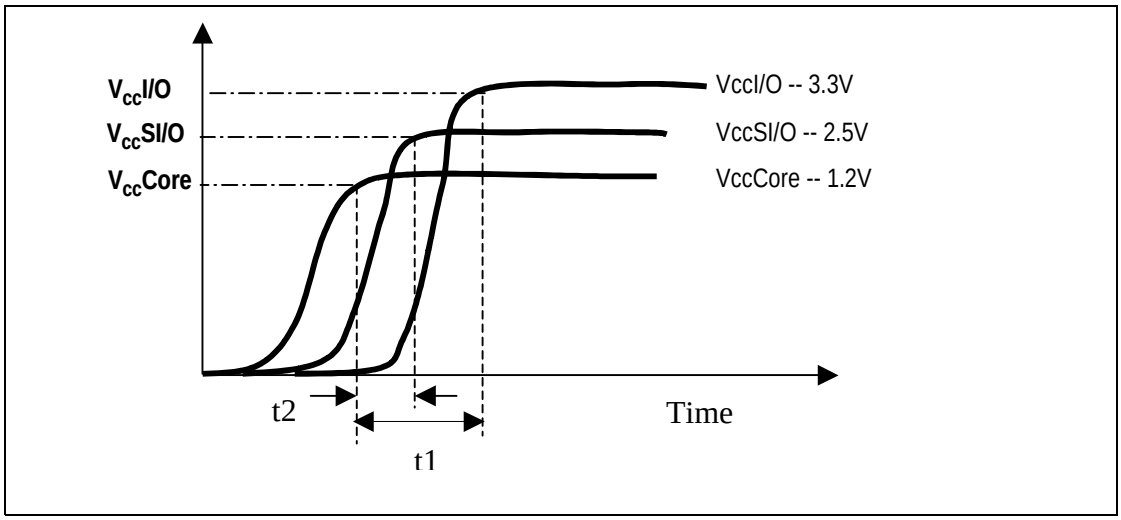
Three power-on sequences are given below. Sequence #1 is recommended because it will prevent I/O conflicts and will also allow the input signals to propagate when the I/O powers are brought up.

Note: The ESD diodes may be damaged if one of the voltages is applied and one of the other voltages is at a ground level.

A. Recommended Sequence

t2 > 0 whenever possible (V_{cc}Core)

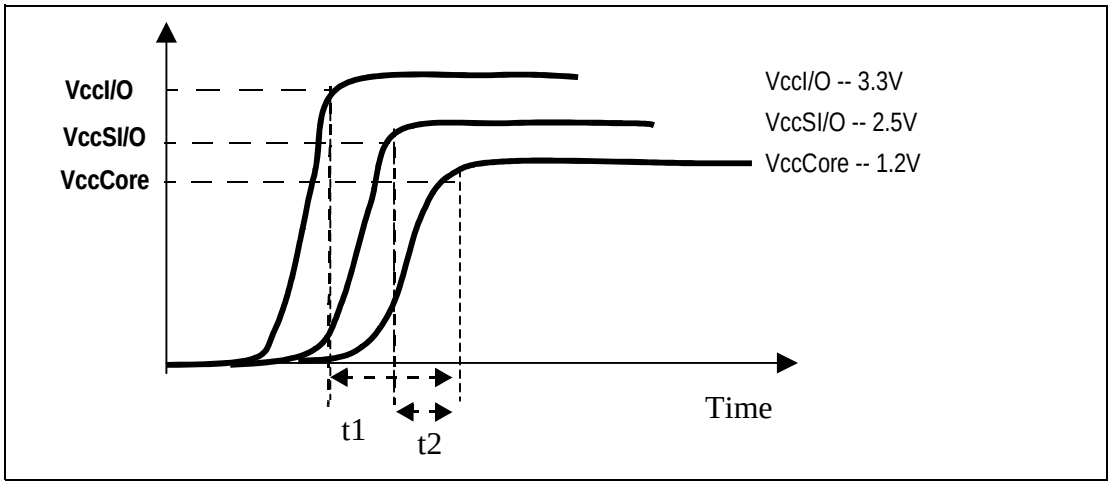
t1 - t2 can be 0 (V_{cc}SI/O followed by V_{cc}I/O)



B. Reverse Voltage Sequence

If sequence A is not feasible, then Sequence B can be used:

t1 <50ms and t2 <50ms to prevent damage.



C. Simultaneous Power-up

VccI/O, VccSI/O, and VccCore can be powered up simultaneously.

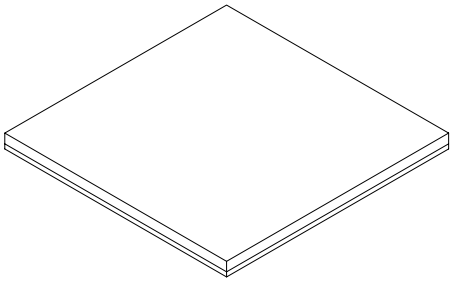
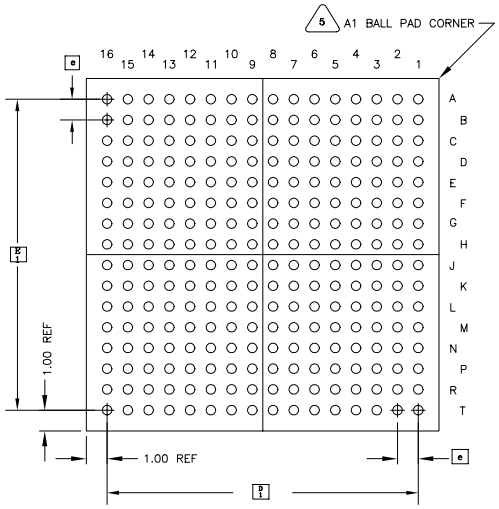
	02	UPDATE MAX. THICKNESS A	10/02/02	





BOTTOM VIEW
256 SOLDER BALLS

NOTES: UNLESS OTHERWISE SPECIFIED

1. ALL DIMENSIONS AND TOLERANCES CONFORM TO ASME Y14.5M–1994.
2. "e" REPRESENTS THE BASIC SOLDER BALL GRID PITCH.
3. "MD" IS THE MAXIMUM SOLDER BALL MATRIX SIZE IN THE "D" DIRECTION.
   "ME" IS THE MAXIMUM SOLDER BALL MATRIX SIZE IN THE "E" DIRECTION.
4. "N" IS THE MAXIMUM ALLOWABLE NUMBER OF SOLDER BALLS.
5. DIMENSION "b" IS MEASURED AT THE MAXIMUM SOLDER BALL DIAMETER, PARALLEL TO PRIMARY DATUM Z.
6. PRIMARY DATUM Z AND SEATING PLANE ARE DEFINED BY THE SPHERICAL CROWNS OF THE SOLDER BALLS.
7. "A1" ID CORNER MUST BE IDENTIFIED. IDENTIFICATION MAY BE BY MEANS OF CHAMFER, METALLIZED OR INK MARK, INDENTATION OR OTHER FEATURE OF THE PACKAGE BODY.
8. ALL DIMENSIONS ARE IN MILLIMETERS.
9. THIS DRAWING CONFORMS TO JEDEC PUBLICATION 95 REGISTRATION MO–192 VARIATION AAF–1
   EXCEPTIONS:
   b MIN=0.41 NOM=0.46 MAX=0.51

UNLESS OTHERWISE SPECIFIED DIMENSIONS ARE IN MILLIMETERS
DECIMAL: X.X ±0.10, X.XX ±0.05, X.XXX ±0.00
ANGULAR: ±1°
