
Welcome to E-XFL.COM

Understanding Embedded - Microprocessors

Embedded microprocessors are specialized computing chips designed to perform specific tasks within an embedded system. Unlike general-purpose microprocessors found in personal computers, embedded microprocessors are tailored for dedicated functions within larger systems, offering optimized performance, efficiency, and reliability. These microprocessors are integral to the operation of countless electronic devices, providing the computational power necessary for controlling processes, handling data, and managing communications.

Applications of Embedded - Microprocessors

Embedded microprocessors are utilized across a broad spectrum of applications, making them indispensable in

Details	
Product Status	Obsolete
Core Processor	MIPS32
Number of Cores/Bus Width	1 Core, 32-Bit
Speed	400MHz
Co-Processors/DSP	-
RAM Controllers	DDR
Graphics Acceleration	No
Display & Interface Controllers	-
Ethernet	10/100Mbps (1)
SATA	-
USB	-
Voltage - I/O	3.3V
Operating Temperature	0°C ~ 70°C (TA)
Security Features	-
Package / Case	256-LBGA
Supplier Device Package	256-CABGA (17x17)
Purchase URL	https://www.e-xfl.com/product-detail/renesas-electronics-america/79rc32h435-400bc

Memory and I/O Controller

The RC32435 uses a dedicated local memory/IO controller including a de-multiplexed 8-bit data and 26-bit address bus. It includes all of the signals required to interface directly to a maximum of four Intel or Motorola-style external peripherals.

DMA Controller

The DMA controller consists of 6 independent DMA channels, all of which operate in exactly the same manner. The DMA controller off-loads the CPU core from moving data among the on-chip interfaces, external peripherals, and memory. The controller supports scatter/gather DMA with no alignment restrictions, making it appropriate for communications and graphics systems.

UART Interface

The RC32435 contains a serial channel (UART) that is compatible with the industry standard 16550 UART.

I^{2}C Interface

The standard I2C interface allows the RC32435 to connect to a number of standard external peripherals for a more complete system solution. The RC32435 supports both master and slave operations.

General Purpose I/O Controller

The RC32435 has 14 general purpose input/output pins. Each pin may be used as an active high or active low level interrupt or non-maskable interrupt input, and each signal may be used as a bit input or output port.

System Integrity Functions

The RC32435 contains a programmable watchdog timer that generates a non-maskable interrupt (NMI) when the counter expires and also contains an address space monitor that reports errors in response to accesses to undecoded address regions.

Thermal Considerations

The RC32435 is guaranteed in an ambient temperature range of 0° to +70° C for commercial temperature devices and - 40° to +85° for industrial temperature devices.

Revision History

January 19, 2006: Initial publication.

Signal	Type	Name/Description
PCILOCKN	I/O	**PCI Lock**. This signal is asserted by an external bus master to indicate that an exclusive operation is occurring.
PCIPAR	I/O	**PCI Parity**. Even parity of the PCIAD[31:0] bus. Driven by the bus master during address and write Data phases. Driven by the bus target during the read data phase.
PCIPERRN	I/O	**PCI Parity Error**. If a parity error is detected, this signal is asserted by the receiving bus agent 2 clocks after the data is received.
PCIREQN[3:0]	I/O	**PCI Bus Request.** **In PCI host mode with internal arbiter:** These signals are inputs whose assertion indicates to the internal RC32435 arbiter that an agent desires ownership of the PCI bus. **In PCI host mode with external arbiter:** PCIREQN[0]: asserted by the RC32435 to request ownership of the PCI bus. PCIREQN[3:1]: unused and driven high. **In PCI satellite mode:** PCIREQN[0]: this signal is asserted by the RC32435 to request use of the PCI bus. PCIREQN[1]: function changes to PCIIDSEL and is used as a chip select during configuration read and write transactions. PCIREQN[3:2]: unused and driven high.
PCIRSTN	I/O	**PCI Reset**. In host mode, this signal is asserted by the RC32435 to generate a PCI reset. In satellite mode, assertion of this signal initiates a warm reset.
PCISERRN	I/O	**PCI System Error**. This signal is driven by an agent to indicate an address parity error, data parity error during a special cycle command, or any other system error. Requires an external pull-up.
PCISTOPN	I/O	**PCI Stop**. Driven by the bus target to terminate the current bus transaction. For example, to indicate a retry.
PCITRDYN	I/O	**PCI Target Ready**. Driven by the bus target to indicate that the current data can complete.
General Purpose Input/Output		
GPIO[0]	I/O	**General Purpose I/O.** This pin can be configured as a general purpose I/O pin. Alternate function pin name: U0SOUT Alternate function: UART channel 0 serial output.
GPIO[1]	I/O	**General Purpose I/O.** This pin can be configured as a general purpose I/O pin. Alternate function pin name: U0SINP Alternate function: UART channel 0 serial input.
GPIO[2]	I/O	**General Purpose I/O.** This pin can be configured as a general purpose I/O pin. Alternate function pin name: U0RTSN Alternate function: UART channel 0 request to send.
GPIO[3]	I/O	**General Purpose I/O.** This pin can be configured as a general purpose I/O pin. Alternate function pin name: U0CTSN Alternate function: UART channel 0 clear to send.

Table 1 Pin Description (Part 3 of 6)

AC Timing Definitions

Below are examples of the AC timing characteristics used throughout this document.

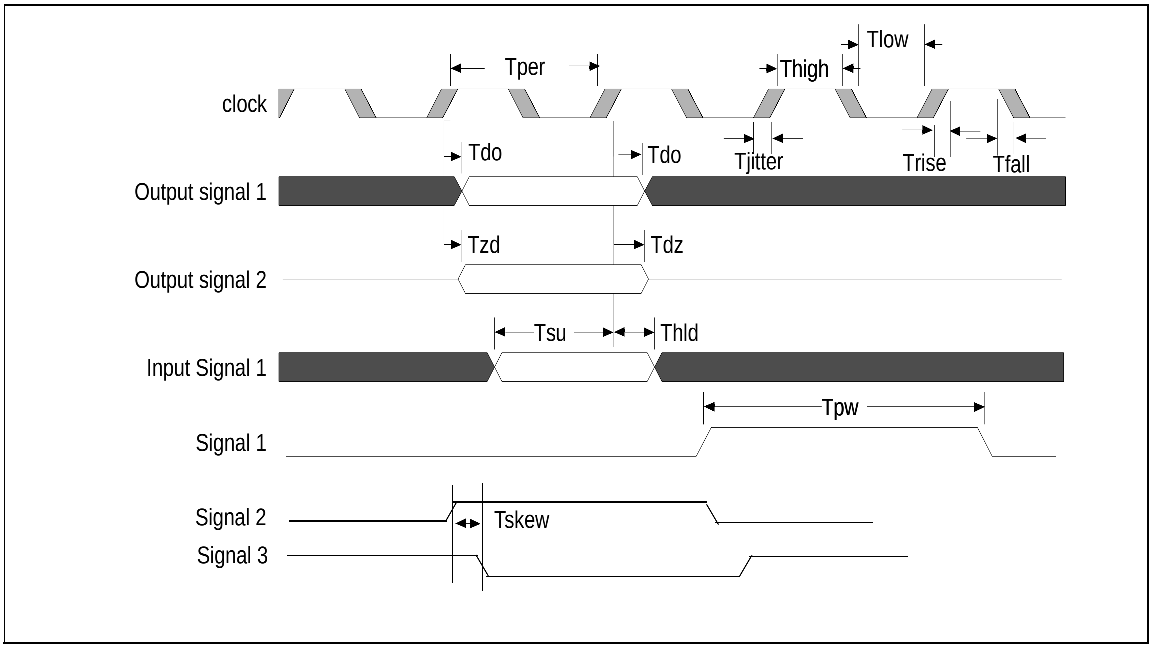

Figure 2 AC Timing Definitions Waveform

Symbol	Definition
Tper	Clock period.
Tlow	Clock low. Amount of time the clock is low in one clock period.
Thigh	Clock high. Amount of time the clock is high in one clock period.
Trise	Rise time. Low to high transition time.
Tfall	Fall time. High to low transition time.
Tjitter	Jitter. Amount of time the reference clock (or signal) edge can vary on either the rising or falling edges.
Tdo	Data out. Amount of time after the reference clock edge that the output will become valid. The minimum time represents the data output hold. The maximum time represents the earliest time the designer can use the data.
Tzd	Z state to data valid. Amount of time after the reference clock edge that the tri-stated output takes to become valid.
Tdz	Data valid to Z state. Amount of time after the reference clock edge that the valid output takes to become tri-stated.
Tsu	Input set-up. Amount of time before the reference clock edge that the input must be valid.
Thld	Input hold. Amount of time after the reference clock edge that the input must remain valid.
Tpw	Pulse width. Amount of time the input or output is active for asynchronous signals.
Tslew	Slew rate. The rise or fall rate for a signal to go from a high to low, or low to high.
X(clock)	Timing value. This notation represents a value of ‘X’ multiplied by the clock time period of the specified clock. Using 5(CLK) as an example: X = 5 and the oscillator clock (CLK) = 25MHz, then the timing value is 200.
Tskew	Skew. The amount of time two signal edges deviate from one another.

Table 4 AC Timing Definitions

System Clock Parameters

(Values based on systems running at recommended supply voltages and operating temperatures, as shown in Tables 15 and 16.)

Parameter	Symbol	Reference Edge	266MHz		300MHz		350MHz		400MHz		Units	Timing Diagram Reference
			Min	**Max**	**Min**	**Max**	**Min**	**Max**	**Min**	**Max**		
PCLK[1]	Frequency	none	200	266	200	300	200	350	200	400	MHz	See Figure 3.
	Tper		3.8	5.0	3.3	5.0	2.85	5.0	2.5	5.0	ns	
ICLK[2,3,4]	Frequency	none	100	133	100	150	100	175	100	200	MHz	
	Tper		7.5	10.0	6.7	10.0	5.7	10.0	5.0	10.0	ns	
CLK[5]	Frequency	none	25	125	25	125	25	125	25	125	MHz	
	Tper_5a		8.0	40.0	8.0	40.0	8.0	40.0	8.0	40.0	ns	
	Thigh_5a, Tlow_5a		40	60	40	60	40	60	40	60	% of Tper_5a	
	Trise_5a, Tfall_5a		—	3.0	—	3.0	—	3.0	—	3.0	ns	
	Tjitter_5a		—	0.1	—	0.1	—	0.1	—	0.1	ns	

Table 5 Clock Parameters

1. The CPU pipeline clock (PCLK) speed is selected during cold reset by the boot configuration vector (see Table 3). Refer to Chapter 3, Clocking and Initialization, in the RC32435 User Reference Manual for the allowable frequency ranges of CLK and PCLK.
2. ICLK is the internal IPBus clock. It is always equal to PCLK divided by 2. This clock cannot be sampled externally.
3. The ethernet clock (MIIxRXCLK and MIIxTXCLK) frequency must be equal to or less than 1/2 ICLK (MIIxRXCLK and MIIxTXCLK <= 1/2(ICLK)).
4. PCICLK must be equal to or less than two times ICLK (PCICLK <= 2(ICLK)) with a maximum PCICLK of 66 MHz.
5. The input clock (CLK) is input from the external oscillator to the internal PLL.

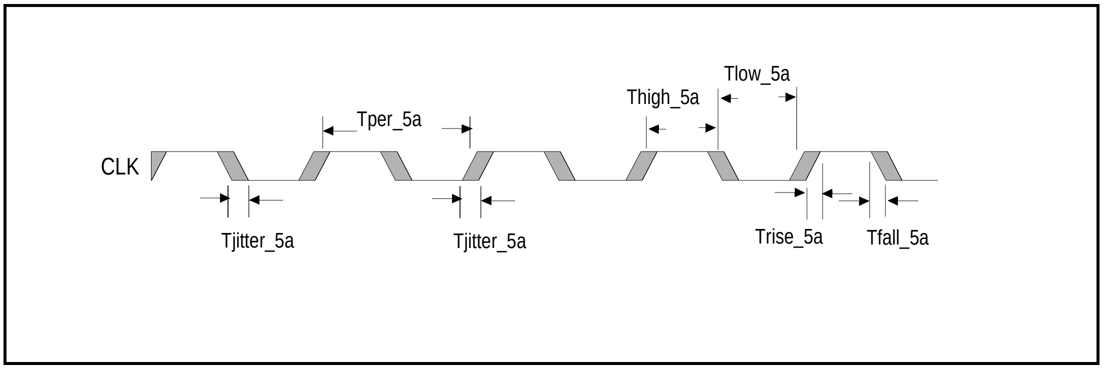

Figure 3 Clock Parameters Waveform

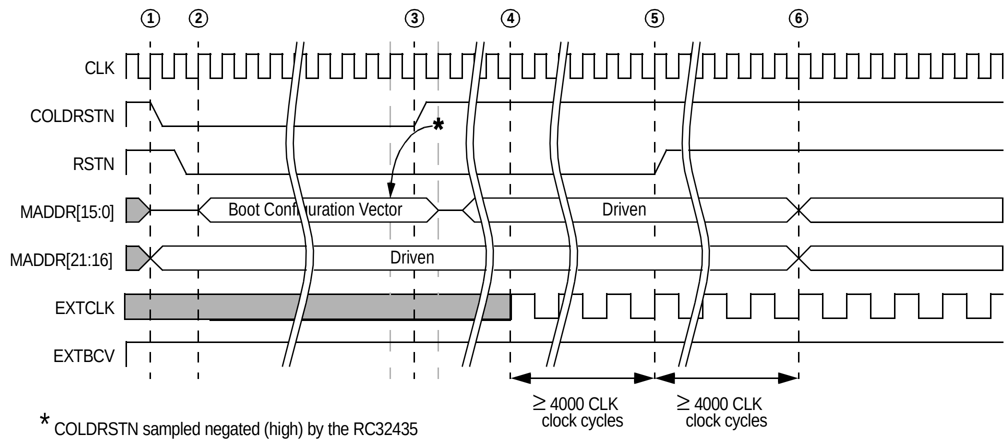
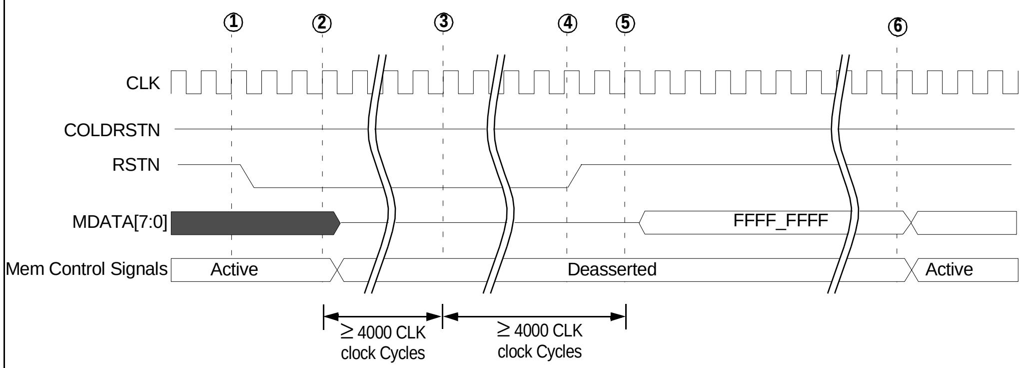


1. EXTBCV is asserted (i.e., pulled-up). COLDRSTN is asserted by external logic. The RC32435 responds by immediately tri-stating the bottom 16-bits of the memory and peripheral address bus (MADDR[15:0]), driving the remaining address bus signals (i.e., MADDR[21:16]), and asserting RSTN. EXTCLK is undefined at this point.
2. External logic drives the boot configuration vector on MADDR[15:0].
3. External logic negates COLDRSTN and tri-states the boot configuration vector on MADDR[15:0]. In response, the RC32435 stops sampling the boot configuration vector and retains the boot configuration vector value seen two clock cycles earlier (i.e., the value on the MADDR[15:0] lines two rising edges of CLK earlier). Within 16 CLK clock cycles after COLDRSTN is sampled negated, the RC32435 begins driving MADDR[15:0].
4. The RC32435 waits for the NVRAM to initialize (if the Disable NVRAM Initialization mode is not selected in the boot configuration vector) and for the PLL to stabilize.
5. The RC32435 then begins generating EXTCLK.
6. After at least 4000 CLK clock cycles, the RC32435 tri-states RSTN.
7. At least 4000 CLK clock cycles after negating RSTN, the RC32435 samples RSTN. If RSTN is negated, cold reset has completed and the RC32435 CPU begins executing by taking MIPS reset exception.

Figure 4 COLD Reset Operation with External Boot Configuration Vector AC Timing Waveform

Note: For a diagram showing the COLD Reset Operation with Internal Boot Configuration Vector, see Figure 3.6 in the RC32435 User Reference Manual.



1. Warm reset condition caused by assertion of RSTN by an external agent.
2. The RC32435 tri-states the data bus, MDATA[7:0], negates all memory control signals, and itself asserts RSTN. The RC32435 continues to drive the address bus throughout the entire warm reset.
3. The RC32435 negates RSTN after 4000 master clock (CLK) clock cycles.
4. External logic negates RSTN.
5. The RC32435 samples RSTN negated at least 4000 master clock (CLK) clock cycles after step 3 and starts driving the data bus, MDATA[7:0].
6. CPU begins executing by taking a MIPS soft reset exception. The assertion of CSN[0] will occur no sooner than 16 clock cycles after the RC32435 samples RSTN negated (i.e., step 5).

Table 7 DDR SDRAM Timing Characteristics

1. Meets DDR timing requirements for 150MHz clock rate DDR SDRAMs with 300 ps remaining margin to compensate for PCB propagation mismatches, which is adequate to guarantee functional timing, provided the RC32435 DDR layout guidelines are adhered to.

2. Setup times are calculated as applicable clock period - Tdo max. For example, if the DDR is running at 266MHz, it uses a 133MHz input clock. The period for a 133MHz clock is 7.5ns. If the Tdo max value is 4.6ns, the T_{IS} parameter is 7.5ns minus 4.6ns = 2.9ns. The DDR spec for this parameter is 1ns, so there is 1.9ns of slack left over for board propagation. Calculations for T_{DS} are similar, but since this parameter is taken relative to the DDRDQS signals, which are referenced on both edges, the effective period with a 133MHz input clock is only 3.75ns. So, if the max Tdo is 1.9ns, we have 3.75ns minus 1.9ns = 1.85ns for T_{DS}. The DDR data sheet specs a value of 0.5ns for 266MHz, so this leaves 1.35ns slack for board propagation delays.

Table 10 PCI AC Timing Characteristics

1. This PCI interface conforms to the PCI Local Bus Specification, Rev 2.2.
2. PCICLK must be equal to or less than two times ICLK (PCICLK <= 2(ICLK)) with a maximum PCICLK of 66 MHz.
3. The values for this symbol were determined by calculation, not by testing.
4. PCIRSTN is an output in host mode and an input in satellite mode.
5. To meet the PCI delay specification from reset asserted to outputs floating, the PCI reset should be logically combined with the COLDRSTN input, instead of input on PCIRSTN.
6. PCISERRN and PCIMUINTN use open collector I/O types.

1. The values for this symbol were determined by calculation, not by testing.

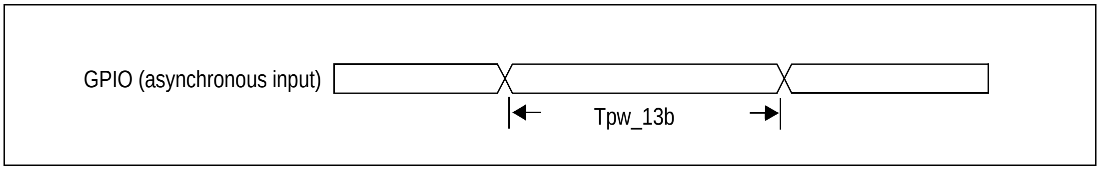

Figure 15 GPIO AC Timing Waveform

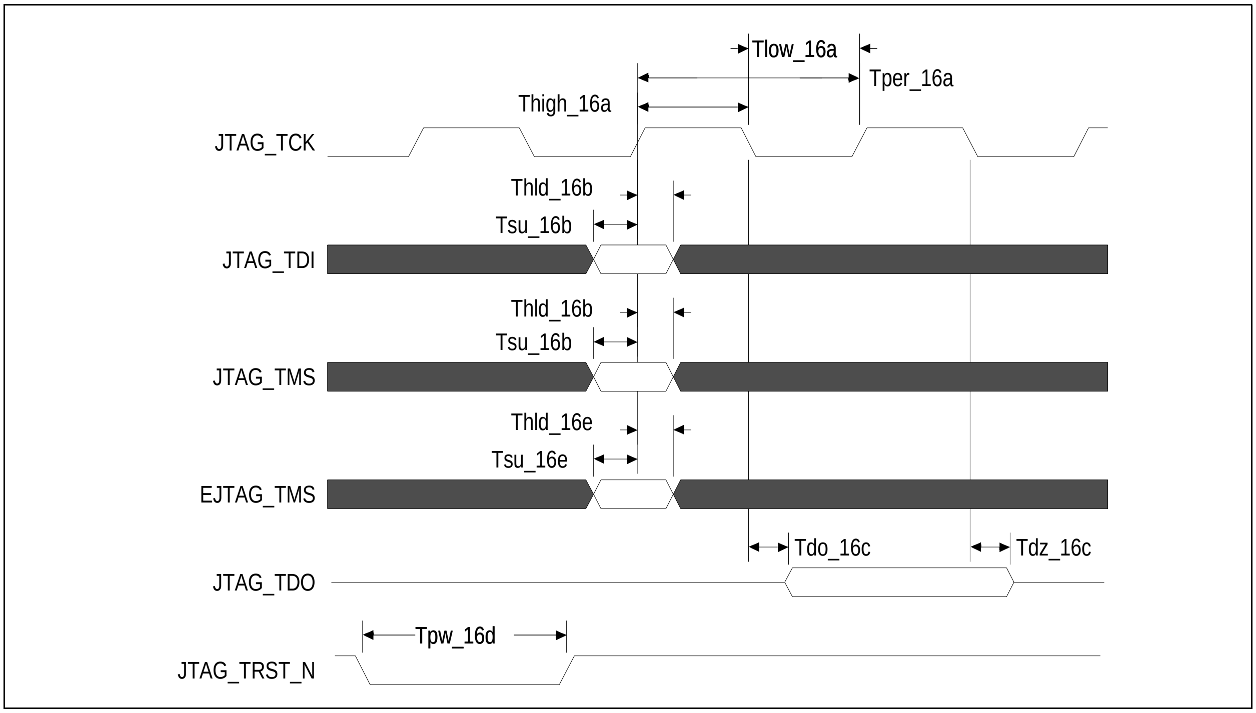

Figure 19 JTAG AC Timing Waveform

The IEEE 1149.1 specification requires that the JTAG and EJTAG TAP controllers be reset at power-up whether or not the interfaces are used for a boundary scan or a probe. Reset can occur through a pull-down resistor on JTAG_TRST_N if the probe is not connected. However, on-chip pull-up resistors are implemented on the RC32435 due to an IEEE 1149.1 requirement. Having on-chip pull-up and external pull-down resistors for the JTAG_TRST_N signal requires special care in the design to ensure that a valid logical level is provided to JTAG_TRST_N, such as using a small external pull-down resistor to ensure this level overrides the on-chip pull-up. An alternative is to use an active power-up reset circuit for JTAG_TRST_N, which drives JTAG_TRST_N low only at power-up and then holds JTAG_TRST_N high afterwards with a pull-up resistor.

Figure 20 shows the electrical connection of the EJTAG probe target system connector.

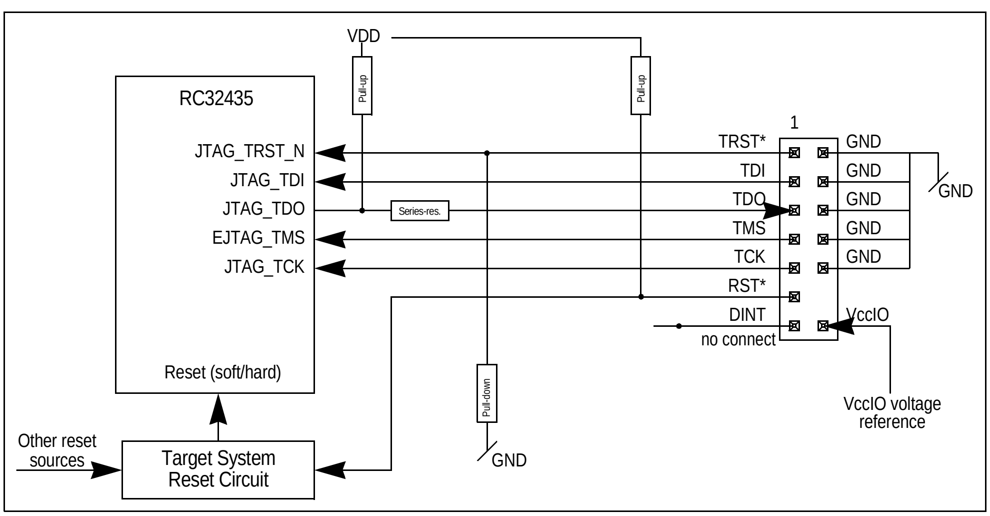

Figure 20 Target System Electrical EJTAG Connection

Using the EJTAG Probe

In Figure 20, the pull-up resistors for JTAG_TDO and RST*, the pull-down resistor for JTAG_TRST_N, and the series resistor for JTAG_TDO must be adjusted to the specific design. However, the recommended pull-up/down resistor is 1.0 kΩ because a low value reduces crosstalk on the cable to the connector, allowing higher JTAG_TCK frequencies. A typical value for the series resistor is 33 Ω. Recommended resistor values have ± 5% tolerance.

If a probe is used, the pull-up resistor on JTAG_TDO must ensure that the JTAG_TDO level is high when no probe is connected and the JTAG_TDO output is tri-stated. This requirement allows reliable connection of the probe if it is hooked-up when the power is already on (hot plug). The pull-up resistor value of around 47 kΩ should be sufficient. Optional diodes to protect against overshoot and undershoot voltage can be added on the signals of the chip with EJTAG.

If a probe is used, the RST* signal must have a pull-up resistor because it is controlled by an open-collector (OC) driver in the probe, and thus is actively pulled low only. The pull-up resistor is responsible for the high value when not driven by the probe of 25pF. The input on the target system reset circuit must be able to accept the rise time when the pull-up resistor charges the capacitance to a high logical level. Vcc I/O must connect to a voltage reference that drops rapidly to below 0.5V when the target system loses power, even with a capacitive load of 25pF. The probe can thus detect the lost power condition.

For additional information on EJTAG, refer to Chapter 17 of the RC32435 User Reference Manual.

Phase-Locked Loop (PLL)

The phase-locked loop (PLL) multiplies the external oscillator input (pin CLK) according to the parameter provided by the boot configuration vector to create the processor clock (PCLK). Inherently, PLL circuits are only capable of generating clock frequencies within a limited range.

PLL Filters

It is recommended that the system designer provide a filter network of passive components for the PLL analog and digital power supplies. The PLL circuit power and PLL circuit ground should be isolated from power and ground with a filter circuit such as the one shown in Figure 21. Because the optimum values for the filter components depend upon the application and the system noise environment, these values should be considered as starting points for further experimentation within your specific application.

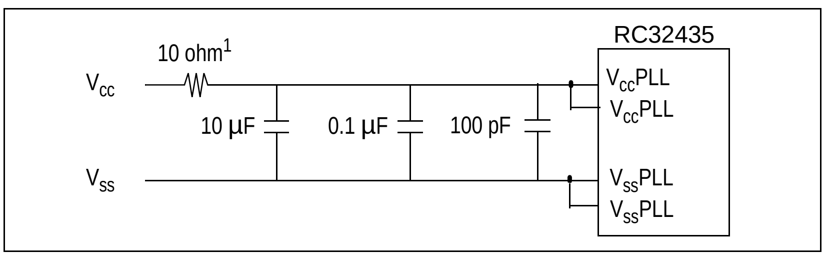

Figure 21 PLL Filter Circuit for Noisy Environments

Power-on Sequence

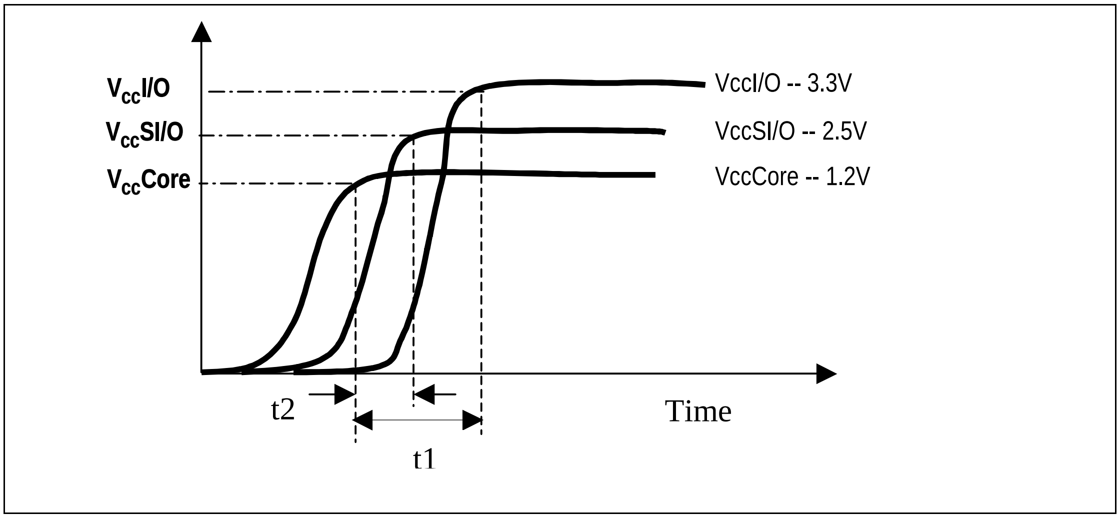
Three power-on sequences are given below. Sequence #1 is recommended because it will prevent I/O conflicts and will also allow the input signals to propagate when the I/O powers are brought up.

Note: The ESD diodes may be damaged if one of the voltages is applied and one of the other voltages is at a ground level.

A. Recommended Sequence

t2 > 0 whenever possible (V_{cc}Core)

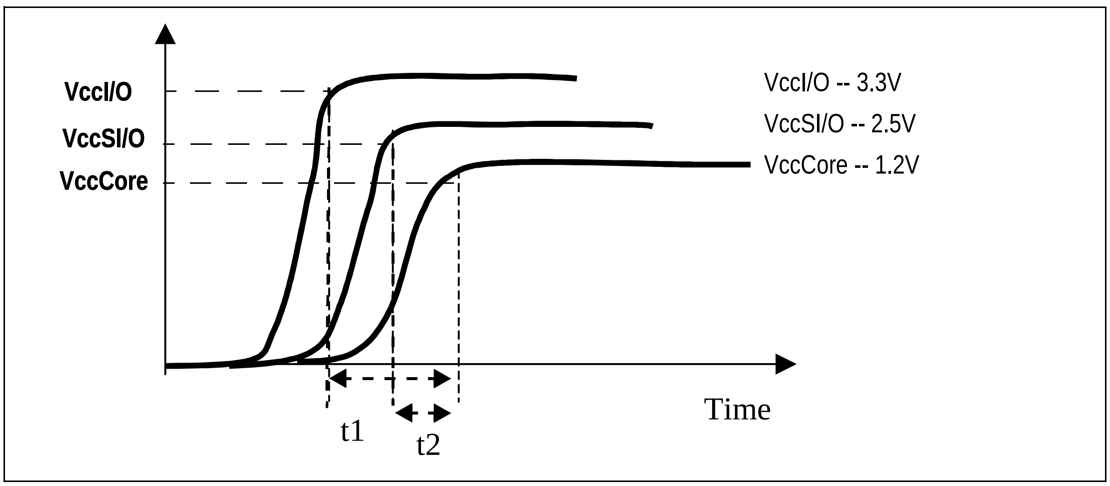
t1 - t2 can be 0 (V_{cc}SI/O followed by V_{cc}I/O)



B. Reverse Voltage Sequence

If sequence A is not feasible, then Sequence B can be used:

t1 <50ms and t2 <50ms to prevent damage.



C. Simultaneous Power-up

VccI/O, VccSI/O, and VccCore can be powered up simultaneously.

Power Consumption

Parameter		266MHz		300MHz		350MHz		400MHz		Unit	Conditions
		Typ.	Max.	Typ.	Max.	Typ.	Max.	Typ.	Max.		
I_{cc} I/O		215	270	220	275	225	280	230	285	mA	C_L = 35 pF $T_{ambient}$ = 25^{o}C Max. values use the maximum voltages listed in Table 15. Typical values use the typical voltages listed in that table. Note: For additional information, see Power Considerations for IDT Processors on the IDT web site www.idt.com.
I_{cc} SI/O (DDR)		70	85	75	90	85	100	95	110	mA	
I_{cc} Core, I_{cc} PLL	Normal mode	325	510	350	550	400	610	450	670	mA	
	Standby mode[1]	220	—	240	—	260	—	280	—	mA	
Power Dissipation	Normal mode	1.27	1.82	1.36	1.90	1.45	2.02	1.54	2.15	W	
	Standby mode[1]	0.73	—	0.78	—	0.84	—	0.90	—	W	

Table 17 RC32435 Power Consumption

1. The RC32435 enter Standby mode by executing WAIT instructions. Minimal I/O switching is assumed. On-chip logic outside the CPU core continues to function.

Power Curve

The following graph contains a power curve that shows power consumption at various core frequencies.

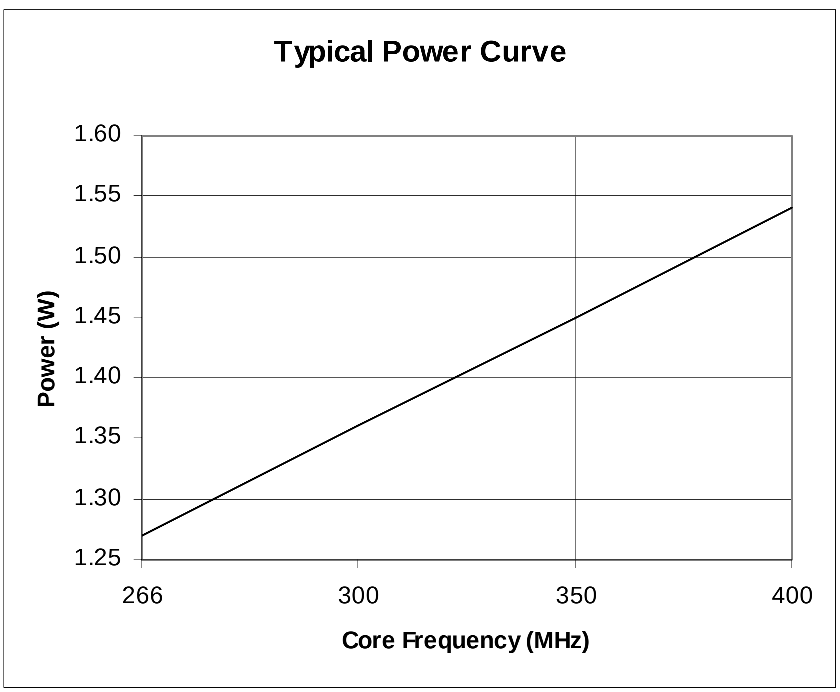


Figure 22 RC32435 Typical Power Usage

Absolute Maximum Ratings

Symbol	Parameter	Min[1]	Max[1]	Unit
V_{CC}I/O	I/O supply except for SSTL_2[2]	-0.6	4.0	V
V_{CC}SI/O (DDR)	I/O supply for SSTL_2[2]	-0.6	4.0	V
V_{CC}Core	Core Supply Voltage	-0.6	2.0	V
V_{CC}PLL	PLL supply (digital)	-0.6	2.0	V
V_{CC}APLL	PLL supply (analog)	-0.6	4.0	V
VinI/O	I/O Input Voltage except for SSTL_2	-0.6	V_{cc}I/O+ 0.5	V
VinSI/O	I/O Input Voltage for SSTL_2	-0.6	V_{cc}SI/O+ 0.5	V
T_a Industrial	Ambient Operating Temperature	-40	+85	°C
T_a Commercial	Ambient Operating Temperature	0	+70	°C
T_s	Storage Temperature	-40	+125	°C

Table 19 Absolute Maximum Ratings

1. Functional and tested operating conditions are given in Table 15. Absolute maximum ratings are stress ratings only, and functional operation at the maximums is not guaranteed. Stresses beyond those listed may affect device reliability or cause permanent damage to the device.

2. SSTL_2 I/Os are used to connect to DDR SDRAM.
