What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

■ DESCRIPTION

The MB90920 series is a family of general-purpose FUJITSU SEMICONDUCTOR 16-bit microcontrollers designed for applications such as vehicle instrument panel control.

The instruction set retains the AT architecture from the F²MC-8L and F²MC-16LX families, with further refinements including high-level language instructions, extended addressing modes, improved multiplication and division operations (signed), and bit processing. In addition, long word processing is made possible by the inclusion of a built-in 32-bit accumulator.

Note : F²MC is the abbreviation of FUJITSU Flexible Microcontroller.

■ FEATURES

- Clock
  Built-in PLL clock frequency multiplication circuit.
  Selection of machine clocks (PLL clocks) is allowed among frequency division by two on oscillation clock, and multiplication of 1 to 8 times of oscillation clock (for 4 MHz oscillation clock, 4 MHz to 32 MHz).
  Operation by sub clock (up to 50 kHz : 100 kHz oscillation clock divided by two) is allowed.
- 16-bit input capture (8 channels)
  Detects rising, falling, or both edges.
  16-bit capture register × 8
  The value of a 16-bit free-run timer counter is latched upon detection of an edge input to pin and an interrupt request is generated.

*1 : For I/O circuit type, refer to “ ■ I/O CIRCUIT TYPES”.

*2 : The I/O circuit type is D for Flash memory products and E for evaluation products.

- **Handling the power supply for high-current output buffer pins** (DV_{CC}, DV_{SS})

  - **Flash memory products and MASK ROM products (MB90F922NC/F922NCS/922NCS/F923NC/ F923NCS/F924NC/F924NCS)**

    In the Flash memory products and MASK ROM products, the power supply for the high-current output buffer pins (DV_{CC}, DV_{SS}) is isolated from the digital power supply (V_{CC}).
    Therefore, DVcc can therefore be set to a higher voltage than Vcc. If the power supply for the high-current output buffer pins (DV_{CC}, DV_{SS}) is supplied before the digital power supply (V_{CC}), however, care needs to be taken because it is possible that the port 7 or port 8 stepping motor outputs may momentarily output an “H” or “L” level. In order to prevent this, connect the digital power supply (V_{CC}) prior to connecting the power supply for the high-current output buffer pins. Even when the high-current output buffer pins are used as general-purpose ports, power should be supplied to the power supply pins for the high-current output buffer pins (DV_{CC}, DV_{SS}).

  - **Evaluation product** (**MB90V920-101**/**MB90V920-102**)

    In the evaluation products, the power supply for the high-current output buffer pins (DV_{CC}, DV_{SS}) is not isolated from the digital power supply (V_{CC}). Therefore, DV_{CC} must therefore be set to a lower voltage than Vcc. The power supply for the high-current output buffer pins (DV_{CC}, DV_{SS}) must always be applied after the digital power supply (V_{CC}) has been connected, and disconnected before the digital power supply (Vcc) is disconnected (the power supply for the high-current output buffer pins may also be connected and disconnected simultaneously with the digital power supply).
    Even when the high-current output buffer pins are used as general-purpose ports, power should be supplied to the power supply pins for the high-current output buffer pins (DV_{CC}, DV_{SS}).

- **Pull-up/pull-down resistors**

MB90920 series does not support internal pull-up/pull-down resistors. Use external components as necessary.

- **Precautions when not using a sub clock signal**

If the X0A and X1A pins are not connected to an oscillator, apply a pull-down resistance to the X0A pin and leave the X1A pin open.

- **Notes on operating when the external clock is stopped**

The MB90920 series is not guaranteed to operate correctly using the internal oscillator circuit when there is no external oscillator or the external clock input is stopped.

- **Flash memory security function**

A security bit is located within the Flash memory region. The security function is activated by writing the protection code 01_H to the security bit.
Do not write the value 01_H to this address if you are not using the security function.
Please refer to following table for the address of the security bit.

	Flash memory size	Address for security bit
MB90F922NC MB90F922NCS	Built-in 2 Mbits Flash Memory	$FC0001_H$
MB90F923NCS	Built-in 3 Mbits Flash Memory	$F80001_H$
MB90F924NCS	Built-in 4 Mbits Flash Memory	$F80001_H$

- **Serial communication**

In serial communication, reception of wrong data may occur due to noise or other causes. Therefore, design a printed circuit board to prevent noise from occurring. Taking account of the reception of wrong data, detect errors by measures such as adding a checksum to the end of data. If an error is detected, retransmit the data.

- **Characteristic difference between flash device and MASK ROM device**

In the flash device and the MASK ROM device, the electrical characteristic including current consumption, ESD, latch-up, the noise characteristic, and oscillation characteristic, etc. is different according to the difference between the chip layout and the memory structure.

Reconfirm the electrical characteristic when the product is replaced by another product of the same series.

*1 : The parameter is based on $V_{SS} = AV_{SS} = DV_{SS} = 0.0$ V.

*2 : AV_{CC}, AVRH must not exceed V_{CC}, and AVRH must not exceed AV_{CC}.
When using an evaluation product, DV_{CC} must not exceed V_{CC} (however, DV_{CC} can be set to a higher voltage than V_{CC} when using a Flash memory product).

*3 : If the input current or the maximum input current is limited using external components, I_{CLAMP} is the applicable rating instead of V_I.

*4 : Maximum output current is defined as the peak value of current through any one of the corresponding pins.

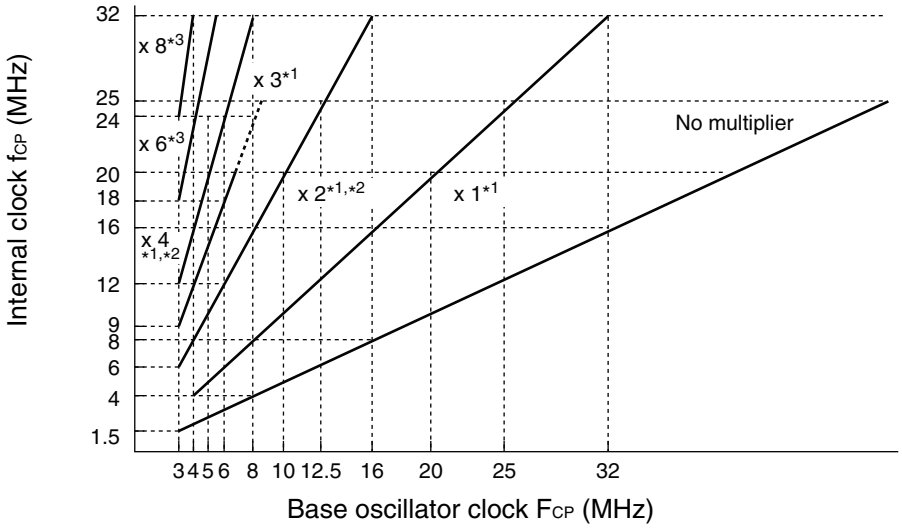
Base oscillator frequency vs. Internal operating clock frequency



*1 : When the PLL multiplier is × 1, × 2, × 3 or × 4 and the internal clock is 20 MHz < f_{CP} ≤ 32 MHz, set DIV2 bit = "1"*4, CS2 bit = "1" in the PSCCR register.
[Example] When using a base oscillator frequency of 24 MHz at PLL × 1 :
CKSCR register : CS1 bit = "0", CS0 bit = "0"
PSCCR register : DIV2 bit = "1"*4,CS2 bit = "1"
[Example] When using a base oscillator frequency of 6 MHz at PLL × 3 :
CKSCR register : CS1 bit = "1", CS0 bit = "0"
PSCCR register : DIV2 bit = "1"*4, CS2 bit = "1"

*2 : When the PLL multiplier is × 2 or × 4 and the internal clock is 20 MHz < f_{CP} ≤ 32 MHz, the following settings are also supported.
PLL × 2 : CKSCR register : CS1 bit = "0", CS0 bit = "0"
PSCCR register : DIV2 bit = "0"*4, CS2 bit = "0"
PLL × 4 : CKSCR register : CS1 bit = "0", CS0 bit = "1"
PSCCR register : DIV2 bit = "0"*4, CS2 bit = "0"

*3 : When the PLL multiplier is set to × 6 or × 8 set "DIV2 bit = "0"*4 CS2 bit = "1" and "PLL2 bit = 1" in the PSCCR register.
[Example] When using a base oscillator frequency of 4 MHz at PLL × 6 :
