What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

■ DESCRIPTION

The MB90920 series is a family of general-purpose FUJITSU SEMICONDUCTOR 16-bit microcontrollers designed for applications such as vehicle instrument panel control.

The instruction set retains the AT architecture from the F²MC-8L and F²MC-16LX families, with further refinements including high-level language instructions, extended addressing modes, improved multiplication and division operations (signed), and bit processing. In addition, long word processing is made possible by the inclusion of a built-in 32-bit accumulator.

Note : F²MC is the abbreviation of FUJITSU Flexible Microcontroller.

■ FEATURES

- Clock
  Built-in PLL clock frequency multiplication circuit.
  Selection of machine clocks (PLL clocks) is allowed among frequency division by two on oscillation clock, and multiplication of 1 to 8 times of oscillation clock (for 4 MHz oscillation clock, 4 MHz to 32 MHz).
  Operation by sub clock (up to 50 kHz : 100 kHz oscillation clock divided by two) is allowed.
- 16-bit input capture (8 channels)
  Detects rising, falling, or both edges.
  16-bit capture register × 8
  The value of a 16-bit free-run timer counter is latched upon detection of an edge input to pin and an interrupt request is generated.

■ HANDLING DEVICES

• Strictly observe maximum rated voltages (preventing latch-up)

In CMOS IC devices, a condition known as latch-up may occur if voltages higher than V_{CC} or lower than V_{SS} are applied to input or output pins other than medium or high withstand voltage pins, or if the voltage applied between VCC and VSS pins exceeds the rated voltage level. If a latch-up occurs, the power supply current may increase dramatically and may destroy semiconductor elements. When using semiconductor devices, always take sufficient care to avoid exceeding maximum ratings.

When the analog system power supply is switched on or off, be careful not to apply the analog power supply (AV_{CC}, AVRH), the analog input voltages and the power supply voltage for the high current output buffer pins (DV_{CC}) in excess of the digital power supply voltage (V_{CC}).

Once the digital power supply voltage (V_{CC}) has been disconnected, the analog power supply (AV_{CC}, AVRH) and the power supply voltage for the high current output buffer pins (DV_{CC}) may be turned on in any sequence.

• Supply voltage stabilization

Rapid fluctuations in the power supply voltage can cause malfunctions even if the Vcc power supply voltage remains within the warranted operating range. It is recommended that the power supply be stabilized such that ripple fluctuations (P-P value) at commercial frequencies (50 Hz/60 Hz) be limited to within 10% of the standard V_{CC} value, and that transient fluctuations due to power supply switching, etc. be limited to a rate of 0.1 V/ms or less.

• Precautions when turning the power on

In order to prevent the built-in step-down circuits from malfunctioning, the time taken for the voltage to rise (0.2 V to 2.7 V) during power-on should be less than 50 μs.

• Handling unused pins

If unused input pins are left open, they may cause malfunctions or latch-up which may lead to permanent damage to the semiconductor. Unused input pins should therefore be pulled up or pulled down through a resistor of at least 2 kΩ.

Unused input/output pins may be set to the output state and left open, or set to the input state and connected to a pull-up or pull-down resistance of 2 kΩ or more.

• Handling A/D converter power supply pins

Even if the A/D converter is not used, the power supply pins should be connected such as $AV_{CC} = V_{CC}$, and $AV_{SS} = AVRH = V_{SS}$.

• Notes on using an external clock

Even when an external clock is used, an oscillation stabilization wait time is required following power-on reset or release from sub clock mode or stop mode. Furthermore, only the X0A pin should be driven when an external clock is used, with the X1A pin open as shown in the following diagram. Do not use high-speed oscillation pins (X0 and X1) for external clock input.

◎ : Usable, and has expanded intelligent I/O services (EI²OS) stop function
○ : Usable
△ : Usable when interrupt sources sharing ICR are not in use
× : Unusable

*1 : • Peripheral functions that share the ICR register have the same interrupt level.
• If the expanded intelligent I/O service (EI²OS) is used with peripheral functions that share the ICR register, only one of the peripheral functions that share the register can be used.
• When the expanded intelligent I/O service (EI²OS) is specified for one of the peripheral functions that shares the ICR register, interrupts cannot be used from the other peripheral functions that share the register.

*2 : Priority applies when interrupts of the same level are generated.
