#### What is "[Embedded - Microcontrollers](#)"?

"[Embedded - Microcontrollers](#)" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

##### Details

Product Status	Obsolete
Core Processor	F <sup>2</sup> MC-16LX
Core Size	16-Bit
Speed	32MHz
Connectivity	CANbus, LINbus, UART/USART
Peripherals	LCD, LVD, POR, PWM, WDT
Number of I/O	93
Program Memory Size	256KB (256K x 8)
Program Memory Type	Mask ROM
EEPROM Size	-
RAM Size	10K x 8
Voltage - Supply (Vcc/Vdd)	4V ~ 5.5V
Data Converters	A/D 8x8/10b
Oscillator Type	External
Operating Temperature	-40°C ~ 105°C (TA)
Mounting Type	Surface Mount
Package / Case	120-LQFP
Supplier Device Package	120-LQFP (16x16)

- **Serial communication**

In serial communication, reception of wrong data may occur due to noise or other causes. Therefore, design a printed circuit board to prevent noise from occurring. Taking account of the reception of wrong data, detect errors by measures such as adding a checksum to the end of data. If an error is detected, retransmit the data.

- **Characteristic difference between flash device and MASK ROM device**

In the flash device and the MASK ROM device, the electrical characteristic including current consumption, ESD, latch-up, the noise characteristic, and oscillation characteristic, etc. is different according to the difference between the chip layout and the memory structure.

Reconfirm the electrical characteristic when the product is replaced by another product of the same series.

◎ : Usable, and has expanded intelligent I/O services (EI<sup>2</sup>OS) stop function

○ : Usable

△ : Usable when interrupt sources sharing ICR are not in use

× : Unusable

\*1 : • Peripheral functions that share the ICR register have the same interrupt level.

- If the expanded intelligent I/O service (EI<sup>2</sup>OS) is used with peripheral functions that share the ICR register, only one of the peripheral functions that share the register can be used.
- When the expanded intelligent I/O service (EI<sup>2</sup>OS) is specified for one of the peripheral functions that shares the ICR register, interrupts cannot be used from the other peripheral functions that share the register.

\*2 : Priority applies when interrupts of the same level are generated.

Storage temperature	T <sub>STG</sub>	– 55	+ 150	°C	

\*1 : The parameter is based on V<sub>SS</sub> = A<sub>VSS</sub> = D<sub>VSS</sub> = 0.0 V.

\*2 : A<sub>VCC</sub>, A<sub>VRH</sub> must not exceed V<sub>CC</sub>, and A<sub>VRH</sub> must not exceed A<sub>VCC</sub>.

When using an evaluation product, D<sub>VCC</sub> must not exceed V<sub>CC</sub> (however, D<sub>VCC</sub> can be set to a higher voltage than V<sub>CC</sub> when using a Flash memory product).

\*3 : If the input current or the maximum input current is limited using external components, I<sub>CLAMP</sub> is the applicable rating instead of V<sub>I</sub>.

\*4 : Maximum output current is defined as the peak value of current through any one of the corresponding pins.

## (3) Power-on reset

( $V_{CC} = 2.7 \text{ V to } 3.6 \text{ V}$ ,  $V_{SS} = 0.0 \text{ V}$ ,  $T_A = -40 \text{ }^\circ\text{C to } +105 \text{ }^\circ\text{C}$ )

Parameter	Symbol	Pin name	Conditions	Value		Unit	Remarks
				Min	Max		
Power supply rise time	$t_R$	VCC	—	0.05	30	ms	
Power off time	$t_{OFF}$			1	—	ms	Waiting time until power-on

Note : Extreme variations in power supply voltage may trigger a power-on reset. When the power supply voltage is changed during operation, it is recommended that increases in the voltage smoothed out as shown in the following diagram. The PLL clock of the device should not be in use when varying the voltage. However, the PLL clock may continue to be used if the rate of the voltage drop is 1 V/s or less.

- Notes on the external impedance and sampling time of analog inputs

A/D converter with sample and hold circuit. If the external impedance is too high to keep sufficient sampling time, the analog voltage charged to the internal sample and hold capacitor is insufficient, adversely affecting A/D conversion precision. Therefore, to satisfy the A/D conversion precision standard, consider the relationship between the external impedance and minimum sampling time and either adjust the register value and operating frequency or decrease the external impedance so that the sampling time is longer than the minimum value. If the sampling time is still not sufficient, connect a capacitor of about 0.1  $\mu$ F to the analog input pin.

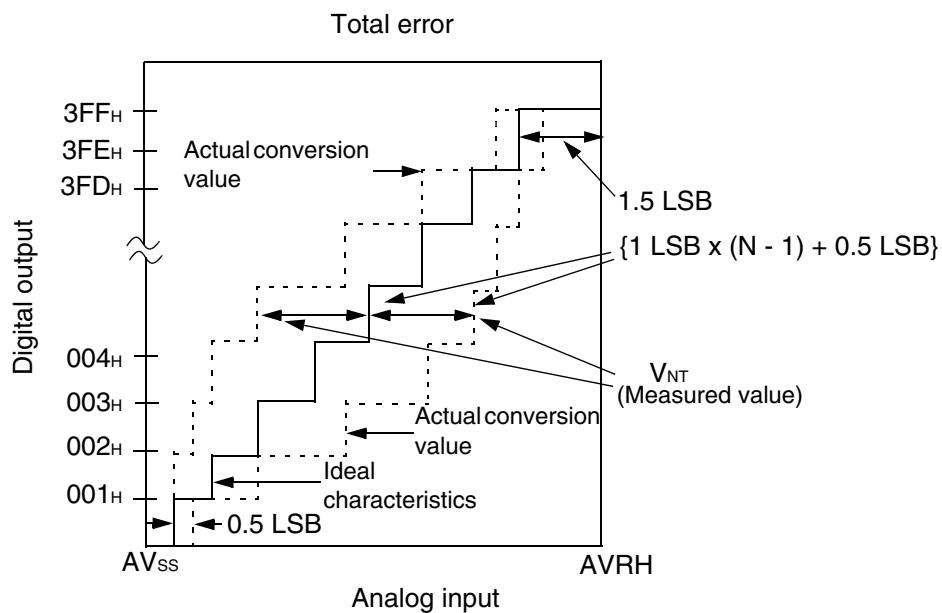

- Analog input equivalent circuit

Note : The values are reference values.

## (2) Definition of terms

- Resolution : Analog changes that are identifiable by the A/D converter.
- Non-Linear error : The deviation of the straight line connecting the zero transition point ("00 0000 0000"  $\longleftrightarrow$  "00 0000 0001") with the full-scale transition point ("11 1111 1110"  $\longleftrightarrow$  "11 1111 1111") from actual conversion characteristics.
- Differential linear error : The deviation from the ideal value of the input voltage needed to change the output code by 1 LSB.
- Total error : The total error is the difference between the actual value and the theoretical value, and includes zero-transition error/full-scale transition error and linear error.

$$\text{Total error for digital output } N = \frac{V_{NT} - \{1 \text{ LSB} \times (N - 1) + 0.5 \text{ LSB}\}}{1 \text{ LSB}} \text{ [LSB]}$$

$$1 \text{ LSB (Ideal)} = \frac{\text{AVRH} - \text{AV}_{ss}}{1024} \text{ [V]}$$

N : A/D converter digital output value

$$V_{OT} \text{ (Ideal)} = \text{AV}_{ss} + 0.5 \text{ LSB [V]}$$

$$V_{FST} \text{ (Ideal)} = \text{AVRH} - 1.5 \text{ LSB [V]}$$

V<sub>NT</sub> : Voltage when the digital output changes from (N - 1) to N
