What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Details

Product Status	Obsolete
Core Processor	F ² MC-16LX
Core Size	16-Bit
Speed	32MHz
Connectivity	CANbus, LINbus, UART/USART
Peripherals	LCD, LVD, POR, PWM, WDT
Number of I/O	93
Program Memory Size	256KB (256K x 8)
Program Memory Type	FLASH
EEPROM Size	-
RAM Size	10K x 8
Voltage - Supply (Vcc/Vdd)	4V ~ 5.5V
Data Converters	A/D 8x8/10b
Oscillator Type	External
Operating Temperature	-40°C ~ 105°C (TA)
Mounting Type	Surface Mount
Package / Case	120-LQFP
Supplier Device Package	120-LQFP (16x16)

- **Handling the power supply for high-current output buffer pins (DV_{cc}, DV_{ss})**

- **Flash memory products and MASK ROM products (MB90F922NC/F922NCS/922NCS/F923NC/F923NCS/F924NC/F924NCS)**

In the Flash memory products and MASK ROM products, the power supply for the high-current output buffer pins (DV_{cc}, DV_{ss}) is isolated from the digital power supply (V_{cc}). Therefore, DV_{cc} can therefore be set to a higher voltage than V_{cc}. If the power supply for the high-current output buffer pins (DV_{cc}, DV_{ss}) is supplied before the digital power supply (V_{cc}), however, care needs to be taken because it is possible that the port 7 or port 8 stepping motor outputs may momentarily output an "H" or "L" level. In order to prevent this, connect the digital power supply (V_{cc}) prior to connecting the power supply for the high-current output buffer pins. Even when the high-current output buffer pins are used as general-purpose ports, power should be supplied to the power supply pins for the high-current output buffer pins (DV_{cc}, DV_{ss}).

- **Evaluation product (MB90V920-101/MB90V920-102)**

In the evaluation products, the power supply for the high-current output buffer pins (DV_{cc}, DV_{ss}) is not isolated from the digital power supply (V_{cc}). Therefore, DV_{cc} must therefore be set to a lower voltage than V_{cc}. The power supply for the high-current output buffer pins (DV_{cc}, DV_{ss}) must always be applied after the digital power supply (V_{cc}) has been connected, and disconnected before the digital power supply (V_{cc}) is disconnected (the power supply for the high-current output buffer pins may also be connected and disconnected simultaneously with the digital power supply).

Even when the high-current output buffer pins are used as general-purpose ports, power should be supplied to the power supply pins for the high-current output buffer pins (DV_{cc}, DV_{ss}).

- **Pull-up/pull-down resistors**

MB90920 series does not support internal pull-up/pull-down resistors. Use external components as necessary.

- **Precautions when not using a sub clock signal**

If the X0A and X1A pins are not connected to an oscillator, apply a pull-down resistance to the X0A pin and leave the X1A pin open.

- **Notes on operating when the external clock is stopped**

The MB90920 series is not guaranteed to operate correctly using the internal oscillator circuit when there is no external oscillator or the external clock input is stopped.

- **Flash memory security function**

A security bit is located within the Flash memory region. The security function is activated by writing the protection code 01_H to the security bit.

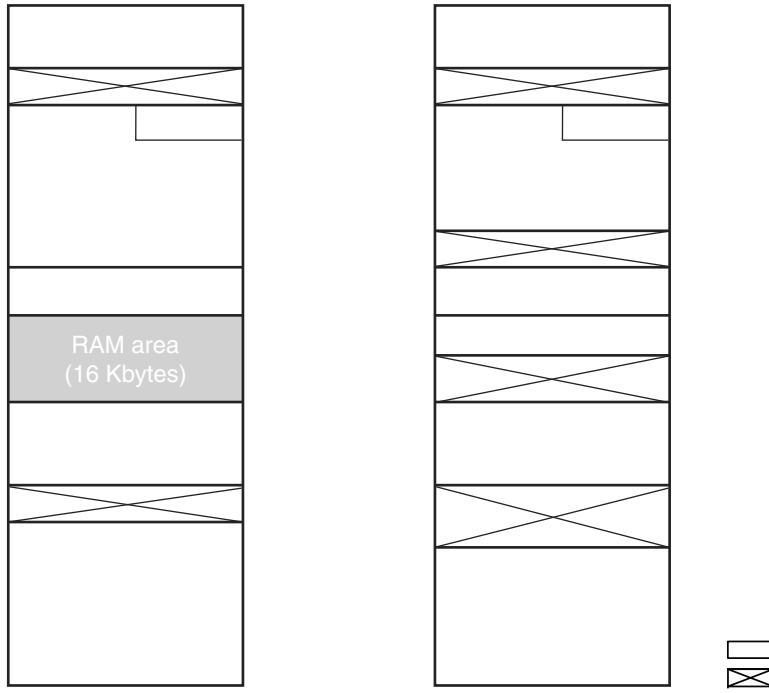

Do not write the value 01_H to this address if you are not using the security function.

Please refer to following table for the address of the security bit.

	Flash memory size	Address for security bit

* : Evaluation products do not contain internal ROM. Treat this address as the ROM decode area used by the tools.

Note: To select models without the ROM mirror function, refer to the "ROM Mirror Function Selection Module" in Hardware Manual. The image of the ROM data in the FF bank appears at the top of the 00 bank, in order to enable efficient use of small C compiler models. The lower 16-bits of the FF bank addresses are allocated to the same addresses as the lower 16-bits of the 00 bank, making it possible to reference tables in ROM without declaring the "far" modifier with the pointers. For example, when an access is made to the address 00C000_H, the actual address to be accessed is FFC000_H in ROM. Because the size of the FF bank ROM area exceeds 32 Kbytes, it is not possible to view the entire region in the 00 bank image. Therefore because the ROM data from FF8000_H to FFFFFF_H appears in the image from 008000_H to 00FFFF_H, it is recommended that ROM data tables be stored in the area from FF8000_H to FFFFFF_H.

- X0A, X1A clock timing

- **Guaranteed PLL Operation Range**

Internal operating clock frequency vs. Power supply voltage

- Notes :
- For PLL 1 × only, use with $t_{CP} = 4$ MHz or greater.
 - Refer to “5. A/D Converter (1) Electrical Characteristics” for details on the A/D converter operating frequency.

(3) Power-on reset

($V_{CC} = 2.7 \text{ V to } 3.6 \text{ V}$, $V_{SS} = 0.0 \text{ V}$, $T_A = -40 \text{ }^{\circ}\text{C} \text{ to } +105 \text{ }^{\circ}\text{C}$)

Parameter	Symbol	Pin name	Conditions	Value		Unit	Remarks
				Min	Max		
Power supply rise time	t_R	VCC	—	0.05	30	ms	
Power off time	t_{OFF}			1	—	ms	Waiting time until power-on

Note : Extreme variations in power supply voltage may trigger a power-on reset. When the power supply voltage is changed during operation, it is recommended that increases in the voltage smoothed out as shown in the following diagram. The PLL clock of the device should not be in use when varying the voltage. However, the PLL clock may continue to be used if the rate of the voltage drop is 1 V/s or less.

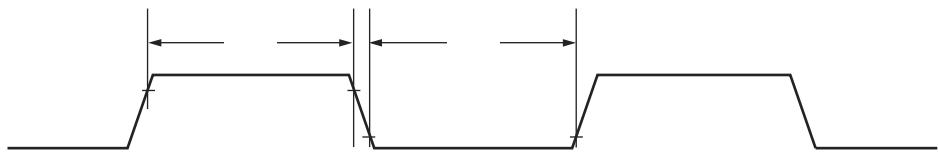

(5) Timer input timing

($V_{CC} = 5.0 \text{ V} \pm 10\%$, $V_{SS} = AV_{SS} = 0.0 \text{ V}$, $T_A = -40 \text{ }^{\circ}\text{C}$ to $+105 \text{ }^{\circ}\text{C}$)

Parameter	Symbol	Pin name	Conditions	Value		Unit
				Min	Max	
Input pulse width	t_{TIWH} t_{TIWL}	TIN0, TIN1, IN0 to IN3	—	4 t_{CP}	—	ns

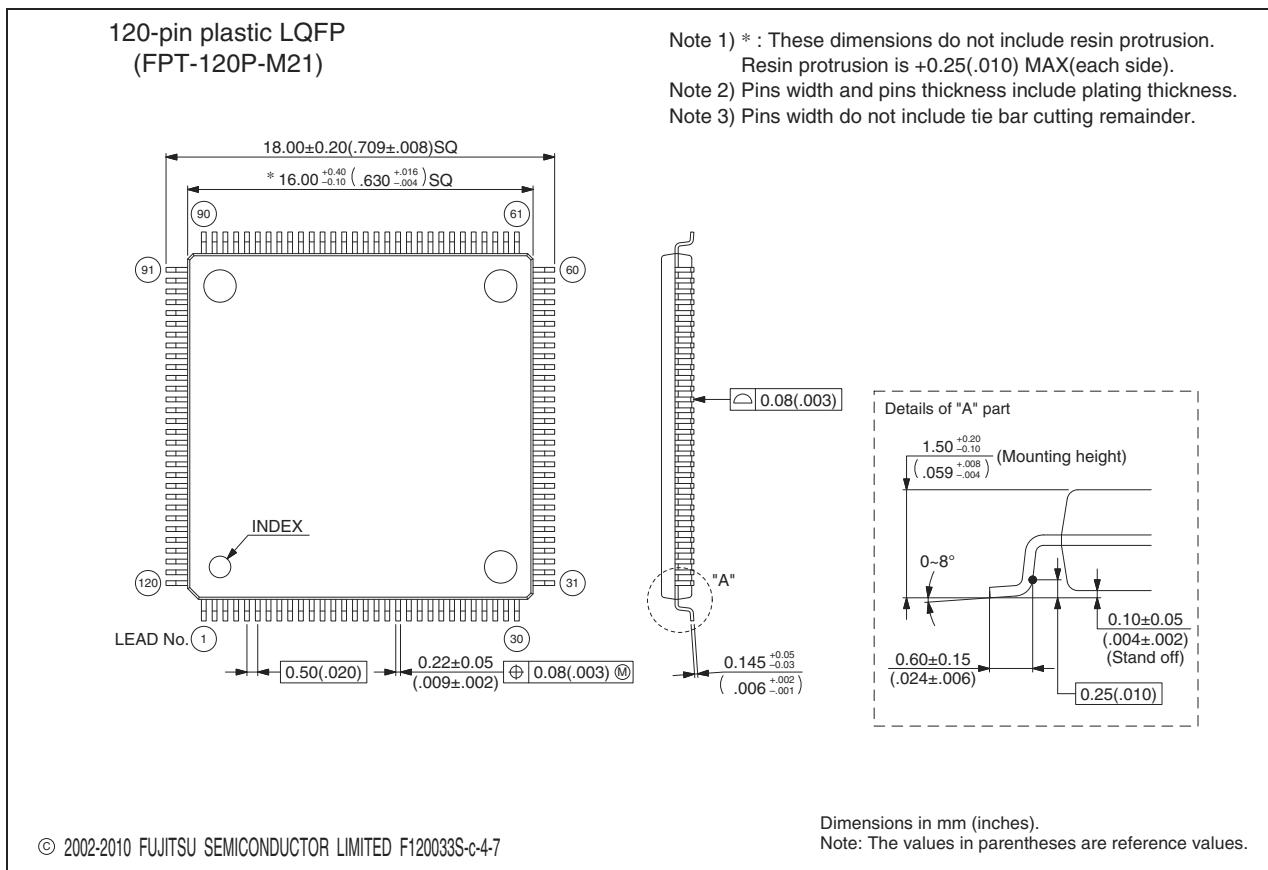

Note : t_{CP} is the internal operating clock cycle time. Refer to “(1) Clock timing”.
