

Welcome to [E-XFL.COM](https://www.e-xfl.com)

### What is "[Embedded - Microcontrollers](#)"?

"[Embedded - Microcontrollers](#)" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

### Applications of "[Embedded - Microcontrollers](#)"

#### Details

## 14.2 Recommended Operating Conditions

| Parameter                    | Symbol    | Value |     |     | Unit    | Remarks                                                            |
|------------------------------|-----------|-------|-----|-----|---------|--------------------------------------------------------------------|
|                              |           | Min   | Typ | Max |         |                                                                    |
| Power supply voltage         | $V_{CC}$  | 3.0   | -   | 5.5 | V       |                                                                    |
| USB power supply voltage     | $V_{CC3}$ | 3.0   | 3.3 | 3.6 | V       | USB device only                                                    |
| Smoothing capacitor at C pin | $C_S$     | 4.7   | -   | 10  | $\mu F$ | Use a low inductance capacitor (for example X7R ceramic capacitor) |

**WARNING:** The recommended operating conditions are required in order to ensure the normal operation of the semiconductor device. All of the device's electrical characteristics are warranted when the device is operated within these ranges.

Always use semiconductor devices within their recommended operating condition ranges. Operation outside these ranges may adversely affect reliability and could result in device failure.

No warranty is made with respect to uses, operating conditions, or combinations not represented on the data sheet. Users considering application outside the listed conditions are advised to contact their Cypress representatives beforehand.

### 14.3 DC characteristics

To satisfy the A/D conversion precision standard, the relationship between the external impedance and minimum sampling time must be considered and then either the resistor value and operating frequency must be adjusted or the external impedance must be decreased so that the sampling time ( $T_{\text{samp}}$ ) is longer than the minimum value. Usually, this value is set to  $7\tau$ , where  $\tau = RC$ . If the external input resistance ( $R_{\text{ext}}$ ) connected to the analog input is included, the sampling time is expressed as follows:

$$T_{\text{samp}} [\text{min}] = 7 \times (R_{\text{ext}} + 2.6\text{k}\Omega) \times C \text{ for } 4.5 \leq AV_{\text{CC}} \leq 5.5$$

$$T_{\text{samp}} [\text{min}] = 7 \times (R_{\text{ext}} + 12.1\text{k}\Omega) \times C \text{ for } 3.0 \leq AV_{\text{CC}} \leq 4.5$$

If the sampling time cannot be sufficient, connect a capacitor of about  $0.1 \mu\text{F}$  to the analog input pin.

### About the error

The accuracy gets worse as  $|AV_{\text{RH}} - AV_{\text{RL}}|$  becomes smaller.

## 14.7 Alarm Comparator
