

Welcome to [E-XFL.COM](https://www.e-xfl.com)

What is "[Embedded - Microcontrollers](#)"?

"[Embedded - Microcontrollers](#)" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "[Embedded - Microcontrollers](#)"

Details

Product Status	Obsolete
Core Processor	eZ8
Core Size	8-Bit
Speed	20MHz
Connectivity	I ² C, IrDA, UART/USART
Peripherals	Brown-out Detect/Reset, POR, PWM, WDT
Number of I/O	11
Program Memory Size	8KB (8K x 8)
Program Memory Type	FLASH
EEPROM Size	-
RAM Size	1K x 8
Voltage - Supply (Vcc/Vdd)	2.7V ~ 3.6V
Data Converters	-
Oscillator Type	Internal
Operating Temperature	-40°C ~ 105°C (TA)
Mounting Type	Surface Mount
Package / Case	20-SSOP (0.209", 5.30mm Width)
Supplier Device Package	-
Purchase URL	https://www.e-xfl.com/product-detail/zilog/z8f0811hh020ec00tr

Operation	171

Address Space

The eZ8 CPU accesses three distinct address spaces:

- The Register File contains addresses for the general-purpose registers and the eZ8 CPU, Peripheral, and GPIO Port Control Registers.
- The Program Memory contains addresses for all memory locations having executable code and/or data.
- The Data Memory contains addresses for all memory locations that hold data only.

These three address spaces are covered briefly in the following sections. For more information on the eZ8 CPU and its address space, refer to *eZ8 CPU Core User Manual (UM0128)* available for download at www.zilog.com.

Register File

The Register File address space in the Z8 Encore! XP[®] is 4 KB (4096 bytes). It is composed of two sections—Control Registers and General-Purpose Registers. When instructions are executed, registers are read from when defined as sources and written to when defined as destinations. The architecture of the eZ8 CPU allows all general-purpose registers to function as accumulators, address pointers, index registers, stack areas, or scratch pad memory.

The upper 256 bytes of the 1 KB Register File address space is reserved for control of the eZ8 CPU, the on-chip peripherals, and the I/O ports. These registers are located at addresses from F00H to FFFH. Some of the addresses within the 256-byte Control Register section is reserved (unavailable). Reading from the reserved Register File addresses returns an undefined value. Writing to reserved Register File addresses is not recommended and can produce unpredictable results.

The on-chip RAM always begins at address 000H in the Register File address space. Z8 Encore! XP F0822 Series contains 1 KB of on-chip RAM. Reading from Register File addresses outside the available RAM addresses (and not within the control register address space) returns an undefined value. Writing to these Register File addresses produces no effect.

Program Memory

The eZ8 CPU supports 64 KB of Program Memory address space. Z8 Encore! XP[®] F0822 Series contain 4 KB to 8 KB on-chip Flash in the Program Memory address space, depending on the device. Reading from Program Memory addresses outside the available Flash addresses returns FFH. Writing to unimplemented Program Memory addresses produces no effect. Table 5 describes the Program Memory Maps for Z8 Encore! XP F0822 Series devices.

Table 5. Z8 Encore! XP[®] F0822 Series Program Memory Maps

Program Memory Address (Hex)	Function
Z8F082x and Z8F081x Products	
0000-0001	Option Bits
0002-0003	Reset Vector
0004-0005	WDT Interrupt Vector
0006-0007	Illegal Instruction Trap
0008-0037	Interrupt Vectors*
0038-1FFF	Program Memory
Z8F042x and Z8F041x Products	
0000-0001	Option Bits
0002-0003	Reset Vector
0004-0005	WDT Interrupt Vector
0006-0007	Illegal Instruction Trap
0008-0037	Interrupt Vectors*
0038-0FFF	Program Memory
Note: *See Table 24 on page 57 for a list of the interrupt vectors.	

Data Memory

Z8 Encore! XP[®] F0822 Series does not use the eZ8 CPU's 64 KB Data Memory address space.

Information Area

Table 6 describes the Z8 Encore! XP F0822 Series Information Area. This 512 byte Information Area is accessed by setting bit 7 of the Page Select Register to 1. When access is enabled, the Information Area is mapped into the Program Memory and overlays the 512 bytes at addresses FE00H to FFFFH. When the Information Area access is enabled, all reads from these Program Memory addresses return the Information Area data rather than the Program Memory data. Access to the Information Area is read-only.

Table 6. Information Area Map

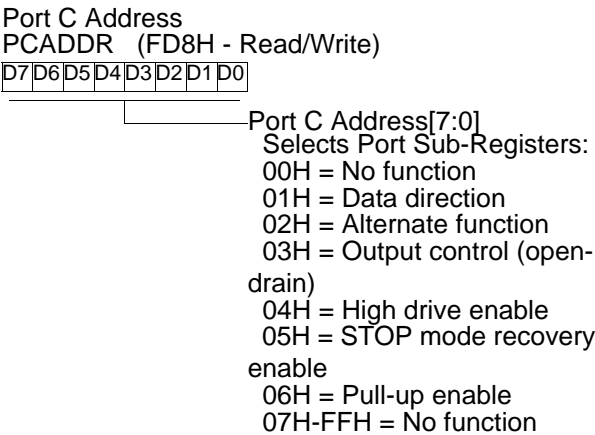

Program Memory Address (Hex)	Function
FE00H-FE3FH	Reserved
FE40H-FE53H	Part Number 20-character ASCII alphanumeric code Left justified and filled with zeros
FE54H-FFFFH	Reserved

Register File Address Map

Table 7 provides the address map for the Register File of the Z8 Encore! XP® F0822 Series products. Not all devices and package styles in the F0822 Series support the ADC, the SPI, or all of the GPIO Ports. Consider registers for unimplemented peripherals as Reserved.

Table 7. Register File Address Map

Address (Hex)	Register Description	Mnemonic	Reset (Hex)	Page No
General Purpose RAM				
000-3FF	General-Purpose Register File RAM	—	XX	
400-EFF	Reserved	—	XX	
Timer 0

XX=Undefined				

Reset and Stop Mode Recovery

The Reset Controller within the Z8 Encore! XP[®] F0822 Series controls Reset and Stop Mode Recovery operation. In typical operation, the following events cause a Reset to occur:

- Power-On Reset (POR)
- Voltage Brownout
- WDT time-out (when configured through the WDT_RES Option Bit to initiate a Reset)
- External $\overline{\text{RESET}}$ pin assertion
- On-Chip Debugger initiated Reset (OCDCTL[0] set to 1)

When the Z8 Encore! XP F0822 Series device is in STOP mode, a Stop Mode Recovery is initiated by any of the following events:

- WDT time-out
- GPIO Port input pin transition on an enabled Stop Mode Recovery source
- DBG pin driven Low

Reset Types

Z8 Encore! XP F0822 Series provides two types of reset operation (System Reset and Stop Mode Recovery). The type of reset is a function of both the current operating mode of the Z8 Encore! XP F0822 Series device and the source of the Reset. Table 8 lists the types of Resets and their operating characteristics.

Table 8. Reset and Stop Mode Recovery Characteristics and Latency

Reset Characteristics and Latency			
Reset Type	Control Registers	eZ8 CPU	Reset Latency (Delay)
System Reset	Reset (as applicable)	Reset	66 WDT Oscillator cycles + 16 System Clock cycles
Stop Mode Recovery	Unaffected, except WDT_CTL register	Reset	66 WDT Oscillator cycles + 16 System Clock cycles

pins. To determine the alternate function associated with each port pin, see GPIO Port Pin Block Diagram on page 48.

! **Caution:** *Do not enable alternate function for GPIO port pins which do not have an associated alternate function. Failure to follow this guideline can result in unpredictable operation.*

Table 17. Port A–CA–C Alternate Function Sub-Registers

BITS	7	6	5	4	3	2	1	0
FIELD	AF7	AF6	AF5	AF4	AF3	AF2	AF1	AF0
RESET	0							
R/W	R/W							
ADDR	If 02H in Port A–C Address Register, accessible through the Port A–C Control Register							

AF[7:0]—Port Alternate Function enabled

0 = The port pin is in NORMAL mode and the DDx bit in the Port A–C Data Direction sub-register determines the direction of the pin.

1 = The alternate function is selected. Port pin operation is controlled by the alternate function.

Port A–C Output Control Sub-Registers

The Port A–C Output Control sub-register (Table 18) is accessed through the Port A–C Control Register by writing 03H to the Port A–C Address Register. Setting the bits in the Port A–C Output Control sub-registers to 1 configures the specified port pins for open-drain operation. These sub-registers affect the pins directly and, as a result, alternate functions are also affected.

Table 18. Port A–C Output Control Sub-Registers

C1ENL—Port C1 Interrupt Request Enable Low Bit

C0ENL—Port C0 Interrupt Request Enable Low Bit

Timers

Z8 Encore! XP[®] F0822 Series products contain up to two 16-bit reloadable timers that can be used for timing, event counting, or generation of pulse-width modulated signals. The timer features include:

- 16-bit reload counter.
- Programmable prescaler with prescale values from 1 to 128.
- PWM output generation.
- Capture and compare capability.
- External input pin for timer input, clock gating, or capture signal. External input pin signal frequency is limited to a maximum of one-fourth the system clock frequency.
- Timer output pin.
- Timer interrupt.

In addition to the timers described in this chapter, the Baud Rate Generators for any unused UART, SPI, or I²C peripherals can also be used to provide basic timing functionality. See the respective serial communication peripheral chapters for information on using the Baud Rate Generators as timers.

Architecture

Figure 10 displays the architecture of the timers.

Operation

The timers are 16-bit up-counters. Minimum time-out delay is set by loading the value 0001H into the Timer Reload High and Low Byte registers and setting the prescale value to 1. Maximum time-out delay is set by loading the value 0000H into the Timer Reload High and Low Byte registers and setting the prescale value to 128. If the Timer reaches FFFFH, the timer rolls over to 0000H and continues counting.

4. If required, enable the timer interrupt and set the timer interrupt priority by writing to the relevant interrupt registers
5. If using the Timer Output function, configure the associated GPIO port pin for the Timer Output alternate function
6. Write to the Timer Control Register to enable the timer and initiate counting

In COMPARE mode, the system clock always provides the timer input. The Compare time is calculated by the following equation:

$$\text{Compare Mode Time (s)} = \frac{(\text{Compare Value} - \text{Start Value}) \times \text{Prescale}}{\text{System Clock Frequency (Hz)}}$$

GATED Mode

In GATED mode, the timer counts only when the Timer Input signal is in its active state (asserted), as determined by the TPOL bit in the Timer Control Register. When the Timer Input signal is asserted, counting begins. A timer interrupt is generated when the Timer Input signal is deasserted or a timer reload occurs. To determine if a Timer Input signal deassertion generated the interrupt, read the associated GPIO input value and compare to the value stored in the TPOL bit.

The timer counts up to the 16-bit Reload value stored in the Timer Reload High and Low Byte Registers. The timer input is the system clock. When reaching the Reload value, the timer generates an interrupt, the count value in the Timer High and Low Byte Registers is reset to 0001H and counting resumes (assuming the Timer Input signal is still asserted). Also, if the Timer Output alternate function is enabled, the Timer Output pin changes state (from Low to High or from High to Low) at timer reset.

Follow the steps below for configuring a timer for GATED mode and initiating the count:

1. Write to the Timer Control Register to:
 - Disable the timer
 - Configure the timer for GATED mode
 - Set the prescale value
2. Write to the Timer High and Low Byte Registers to set the starting count value. This only affects the first pass in GATED mode. After the first timer reset in GATED mode, counting always begins at the reset value of 0001H
3. Write to the Timer Reload High and Low Byte Registers to set the Reload value
4. If desired, enable the timer interrupt and set the timer interrupt priority by writing to the relevant interrupt registers
5. Configure the associated GPIO port pin for the Timer Input alternate function
6. Write to the Timer Control Register to enable the timer
7. Assert the Timer Input signal to initiate the counting

Clear To Send Operation

The CTS pin, if enabled by the CTSE bit of the UART Control 0 register, performs flow control on the outgoing transmit datastream. The Clear To Send ($\overline{\text{CTS}}$) input pin is sampled one system clock before beginning any new character transmission. To delay transmission of the next data character, an external receiver must deassert $\overline{\text{CTS}}$ at least one system clock cycle before a new data transmission begins. For multiple character transmissions, this would be done during STOP bit transmission. If $\overline{\text{CTS}}$ deasserts in the middle of a character transmission, the current character is sent completely.

Multiprocessor (9-bit) Mode

The UART has a MULTIPROCESSOR (9-bit) mode that uses an extra (9th) bit for selective communication when a number of processors share a common UART bus. In MULTIPROCESSOR mode (also referred to as 9-bit mode), the multiprocessor bit is transmitted following the 8-bits of data and immediately preceding the STOP bit(s) as displayed in Figure 14. The character format is as displayed in Figure 14.

Figure 14. UART Asynchronous MULTIPROCESSOR Mode Data Format

In MULTIPROCESSOR (9-bit) mode, the Parity bit location (9th bit) becomes the Multiprocessor control bit. The UART Control 1 and Status 1 Registers provide Multiprocessor (9-bit) mode control and status information. If an automatic address matching scheme is enabled, the UART Address Compare Register holds the network address of the device.

MULTIPROCESSOR (9-bit) Mode Receive Interrupts

When multiprocessor mode is enabled, the UART only processes frames addressed to it. The determination of whether a frame of data is addressed to the UART can be made in hardware, software, or combination of the two depending on the multiprocessor configuration bits. In general, the address compare feature reduces the load on the CPU, because it does not need to access the UART when it receives data directed to other devices on the

Table 75. I²C Diagnostic State Register (I2CDST)

0_1111	10-bit address: Bit 0 (Least significant bit) of 2nd address byte 7-bit address: Bit 0 (Least significant bit) (R/W) of address byte
1_0000	10-bit addressing: Bit 7 (Most significant bit) of 1st address byte
1_0001	10-bit addressing: Bit 6 of 1st address byte
1_0010	10-bit addressing: Bit 5 of 1st address byte
1_0011	10-bit addressing: Bit 4 of 1st address byte
1_0100	10-bit addressing: Bit 3 of 1st address byte
1_0101	10-bit addressing: Bit 2 of 1st address byte
1_0110	10-bit addressing: Bit 1 of 1st address byte

Table 97. DC Characteristics (Continued)

Symbol	Parameter	T _A = -40 °C to 105 °C			Units	Conditions
		Minimum	Typical	Maximum		
V _{RAM}	RAM Data Retention	0.7	—	—	V	
I _{IL}	Input Leakage Current	-5	—	+5	μA	V _{DD} = 3.6 V; V _{IN} = VDD or VSS ¹
I _{TL}	Tri-State Leakage Current	-5	—	+5	μA	V _{DD} = 3.6 V
C _{PAD}	GPIO Port Pad Capacitance	—	8.0 ²	—	pF	
C _{XIN}	XIN Pad Capacitance	—	8.0 ²	—	pF	
C _{XOUT}	XOUT Pad Capacitance	—	9.5 ²	—	pF	
I _{PU1}	Weak Pull-up Current	9	20	50	μA	VDD = 2.7–3.6 V. T _A = 0 °C to +70 °C
I _{PU2}	Weak Pull-up Current	7	20	75	μA	VDD = 2.7–3.6 V. T _A = -40 °C to +105 °C

¹ This condition excludes all pins that have on-chip pull-ups, when driven Low.

² These values are provided for design guidance only and are not tested in production.

Figure 41 on page 189 displays the typical active mode current consumption while operating at 25 °C, 3.3 V, versus the system clock frequency. All GPIO pins are configured as outputs and driven High.

Condition Codes

The C, Z, S, and V flags control the operation of the conditional jump (JP cc and JR cc) instructions. Sixteen frequently useful functions of the flag settings are encoded in a 4-bit field called the condition code (cc), which forms Bits 7:4 of the conditional jump instructions. The condition codes are summarized in Table 117. Some binary condition codes can be created using more than one assembly code mnemonic. The result of the flag test operation decides if the conditional jump is executed.

Table 117. Condition Codes

Binary	Hex	Assembly Mnemonic	Definition	Flag Test Operation
0000	0	F	Always False	–
0001	1	LT	Less Than	$(S \text{ XOR } V) = 1$
0010	2	LE	Less Than or Equal	$(Z \text{ OR } (S \text{ XOR } V)) = 1$
0011	3	ULE	Unsigned Less Than or Equal	$(C \text{ OR } Z) = 1$
0100	4	OV	Overflow	$V = 1$
0101	5	MI	Minus	$S = 1$
0110	6	Z	Zero	$Z = 1$
0110	6	EQ	Equal	$Z = 1$
0111	7	C	Carry	$C = 1$
0111	7	ULT	Unsigned Less Than	$C = 1$
1000	8	T (or blank)	Always True	–
1001	9	GE	Greater Than or Equal	$(S \text{ XOR } V) = 0$
1010	A	GT	Greater Than	$(Z \text{ OR } (S \text{ XOR } V)) = 0$
1011	B	UGT	Unsigned Greater Than	$(C = 0 \text{ AND } Z = 0) = 1$
1100	C	NOV	No Overflow	$V = 0$
1101	D	PL	Plus	$S = 0$
1110	E	NZ	Non-Zero	$Z = 0$
1110	E	NE	Not Equal	$Z = 0$
1111	F	NC	No Carry	$C = 0$
1111	F	UGE	Unsigned Greater Than or Equal	$C = 0$

Opcode Maps

A description of the opcode map data and the abbreviations are provided in Figure 57 and Table 127 on page 230. Figure 58 on page 231 and Figure 59 on page 232 provide information on each of the eZ8 CPU instructions.

Figure 57. Opcode Map Cell Description

Figure 62 displays the 28-pin SOIC package available for Z8 Encore! XP F0822 Series devices.

program control instructions 217
 program counter 212
 program flash
 configurations 153
 program memory 13, 153
 PUSH 216
 push using extended addressing 216
 PUSHX 216
 PWM mode 81
 PxADDR register 50
 PxCTL register 51

R

R 211
 r 211
 RCF 215, 216
 receive
 10-bit data format (I2C) 137
 7-bit data transfer format (I2C) 136
 IrDA data 111
 receive interrupt 128
 receiving UART data-interrupt-driven method 94
 receiving UART data-pollled method 93
 register 124, 211
 ADC control (ADCCCTL) 150
 ADC data high byte (ADCDH) 151
 ADC data low bits (ADC DL) 151
 baud low and high byte (I2C) 143, 145
 baud rate high and low byte (SPI) 125
 control (SPI) 122
 control, I2C 141
 data, SPI 121
 flash control (FCTL) 159
 flash high and low byte (FFREQH and FRE-EQL) 161
 flash page select (FPS) 160
 flash status (FSTAT) 160
 GPIO port A-H address (PxADDR) 50
 GPIO port A-H alternate function sub-registers 52
 GPIO port A-H control address (PxCTL) 51
 GPIO port A-H data direction sub-registers 51
 I2C baud rate high (I2CBRH) 143, 144, 145

I2C control (I2CCTL) 141
 I2C data (I2CDATA) 139
 I2C status 140
 I2C status (I2CSTAT) 140
 I2Cbaud rate low (I2CBRL) 143
 mode, SPI 124
 OCD control 181
 OCD status 183
 SPI baud rate high byte (SPIBRH) 125
 SPI baud rate low byte (SPIBRL) 126
 SPI control (SPICTL) 122
 SPI data (SPIDATA) 121
 SPI status (SPISTAT) 123
 status, I2C 140
 status, SPI 123
 UARTx baud rate high byte (UxBRH) 106
 UARTx baud rate low byte (UxBRL) 106
 UARTx Control 0 (UxCTL0) 103, 106
 UARTx control 1 (UxCTL1) 104
 UARTx receive data (UxRXD) 101
 UARTx status 0 (UxSTAT0) 101
 UARTx status 1 (UxSTAT1) 102
 UARTx transmit data (UxTXD) 100
 watch-dog timer control (WDTCTL) 86
 watch-dog timer reload high byte (WDTH) 88
 watch-dog timer reload low byte (WDTL) 88
 watch-dog timer reload upper byte (WDTU) 87
