Welcome to E-XFL.COM

What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Obsolete
Core Processor	C166
Core Size	16-Bit
Speed	20MHz
Connectivity	EBI/EMI, SPI, UART/USART
Peripherals	POR, PWM, WDT
Number of I/O	63
Program Memory Size	-
Program Memory Type	ROMless
EEPROM Size	-
RAM Size	1K x 8
Voltage - Supply (Vcc/Vdd)	4.5V ~ 5.5V
Data Converters	-
Oscillator Type	External
Operating Temperature	0°C ~ 70°C (TA)
Mounting Type	Surface Mount
Package / Case	80-QFP
Supplier Device Package	P-MQFP-80-1
Purchase URL	https://www.e-xfl.com/product-detail/infineon-technologies/c161klmhabxqma1

Revision History: **2001-01** V2.0

Previous Version: 03.97 (Preliminary)
09.96 (Advance Information)

Page	Subjects (major changes since last revision)
All	Converted to Infineon layout
All	C161V removed
2	Ordering Codes and Cross-Reference replaced with Derivative Synopsis
5 - 8	Open drain functionality described for P2, P3, P6
8	Bidirectional reset introduced
19	Figure updated
28, 29	Revised description of Absolute Max. Ratings and Operating Conditions
32 - 56	Specifications for reduced supply voltage introduced
35	Reduced power consumption
36, 37	Clock Generation Modes added
38, 39	Description of External Clock Drive improved
41 - 56	Standard 25-MHz timing introduced (timing granularity 2 ns)

We Listen to Your Comments

Any information within this document that you feel is wrong, unclear or missing at all? Your feedback will help us to continuously improve the quality of this document. Please send your proposal (including a reference to this document) to:

Introduction

The C161K/O is a derivative of the Infineon C166 Family of full featured single-chip CMOS microcontrollers. It combines high CPU performance (up to 12.5 million instructions per second) with peripheral functionality and enhanced IO-capabilities. The C161K/O is especially suited for cost sensitive applications.

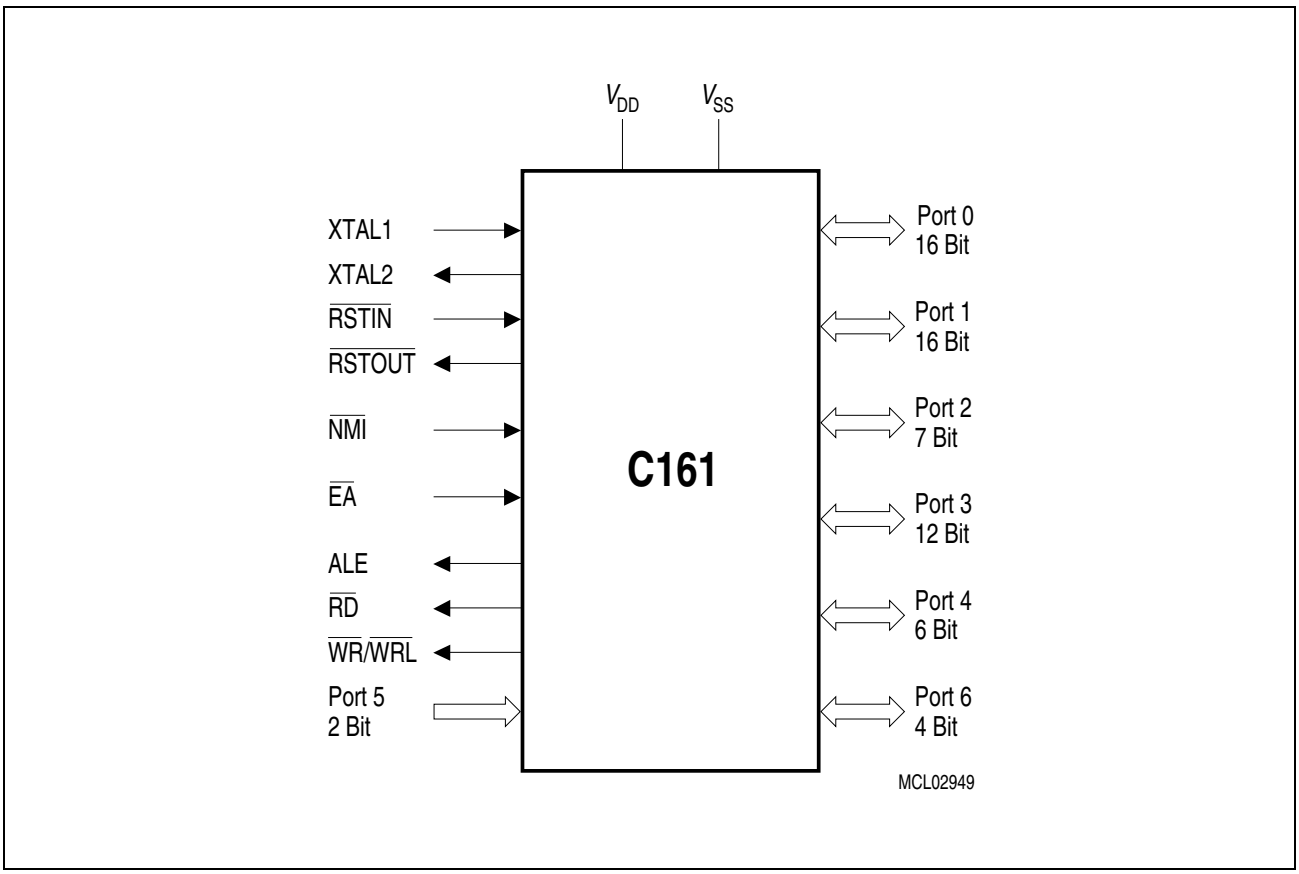

Figure 1 Logic Symbol

Table 2 Pin Definitions and Functions (cont'd)

Symbol	Pin Num	Input Outp.	Function
P2		IO	Port 2 is a 7-bit bidirectional I/O port. It is bit-wise programmable for input or output via direction bits. For a pin configured as input, the output driver is put into high-impedance state. Port 2 outputs can be configured as push/pull or open drain drivers. The following Port 2 pins serve for alternate functions:
P2.9	72	I	EX1IN Fast External Interrupt 1 Input
P2.10	73	I	EX2IN Fast External Interrupt 2 Input
P2.11	74	I	EX3IN Fast External Interrupt 3 Input
P2.12	75	I	EX4IN Fast External Interrupt 4 Input
	76	I	EX5IN Fast External Interrupt 5 Input
	77	I	EX6IN Fast External Interrupt 6 Input
	78	I	EX7IN Fast External Interrupt 7 Input *These external interrupts are **only available in the C161O**.*
P5		I	Port 5 is a 2-bit input-only port with Schmitt-Trigger char. The pins of Port 5 also serve as timer inputs:
P5.14	79	I	T4EUD GPT1 Timer T4 External Up/Down Control Input
P5.15	80	I	T2EUD GPT1 Timer T2 External Up/Down Control Input
V_{DD}	4, 22, 37, 64	–	Digital Supply Voltage: + 5 V or + 3 V during normal operation and idle mode. ≥ 2.5 V during power down mode.
V_{SS}	1, 21, 38, 63	–	Digital Ground.

Note: The following behavioral differences must be observed when the bidirectional reset is active:

- Bit BDRSTEN in register SYSCON cannot be changed after EINIT and is cleared automatically after a reset.
- The reset indication flags always indicate a long hardware reset.
- The PORT0 configuration is treated like on a hardware reset. Especially the bootstrap loader may be activated when P0L.4 is low.
- Pin $\overline{\text{RSTIN}}$ may only be connected to external reset devices with an open drain output driver.
- A short hardware reset is extended to the duration of the internal reset sequence.

Functional Description

The architecture of the C161K/O combines advantages of both RISC and CISC processors and of advanced peripheral subsystems in a very well-balanced way. In addition the on-chip memory blocks allow the design of compact systems with maximum performance.
The following block diagram gives an overview of the different on-chip components and of the advanced, high bandwidth internal bus structure of the C161K/O.

Note: All time specifications refer to a CPU clock of 25 MHz (see definition in the AC Characteristics section).

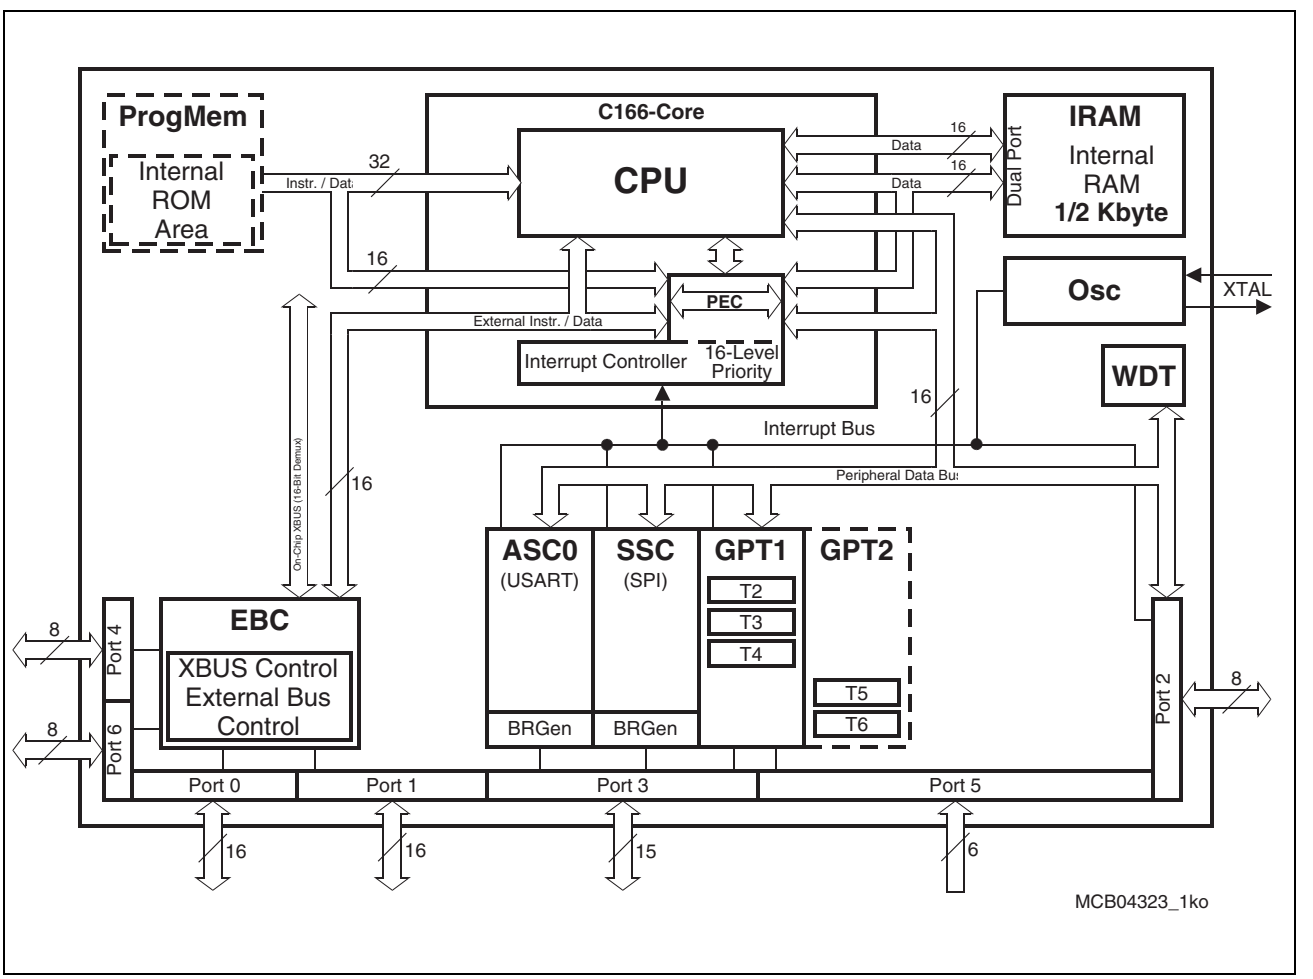

Figure 3 Block Diagram

The program memory, the internal RAM (IRAM) and the set of generic peripherals are connected to the CPU via separate buses. A fourth bus, the XBUS, connects external resources as well as additional on-chip resources, the X-Peripherals (see **Figure 3**).

Central Processing Unit (CPU)

The main core of the CPU consists of a 4-stage instruction pipeline, a 16-bit arithmetic and logic unit (ALU) and dedicated SFRs. Additional hardware has been spent for a separate multiply and divide unit, a bit-mask generator and a barrel shifter.

Based on these hardware provisions, most of the C161K/O's instructions can be executed in just one machine cycle which requires 80 ns at 25 MHz CPU clock. For example, shift and rotate instructions are always processed during one machine cycle independent of the number of bits to be shifted. All multiple-cycle instructions have been optimized so that they can be executed very fast as well: branches in 2 cycles, a 16 × 16 bit multiplication in 5 cycles and a 32-/16 bit division in 10 cycles. Another pipeline optimization, the so-called 'Jump Cache', allows reducing the execution time of repeatedly performed jumps in a loop from 2 cycles to 1 cycle.

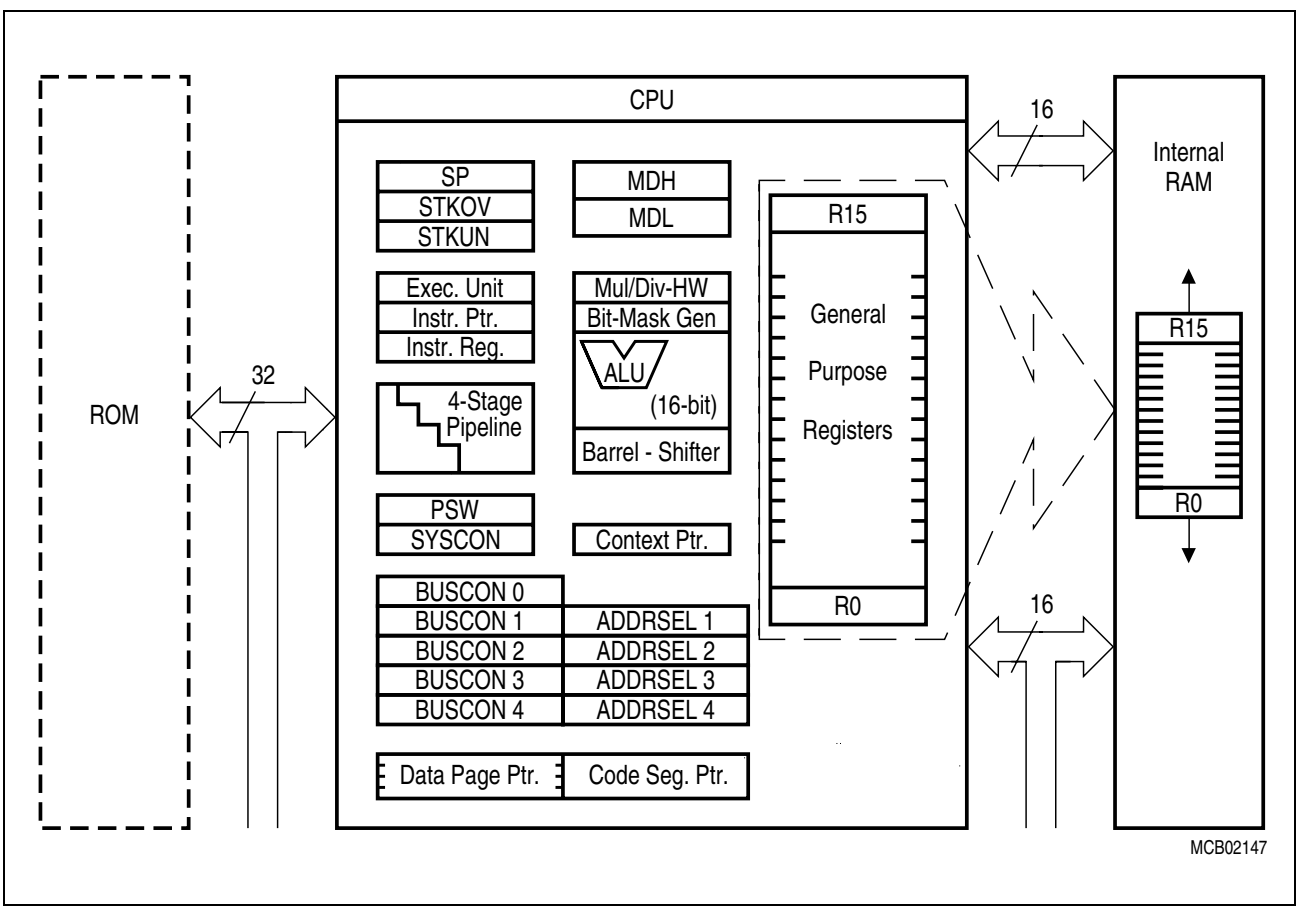

Figure 4 CPU Block Diagram

Table 3 C161K/O Interrupt Nodes

Source of Interrupt or PEC Service Request	Request Flag	Enable Flag	Interrupt Vector	Vector Location	Trap Number
External Interrupt 1	CC9IR	CC9IE	CC9INT	$00'0064_H$	19_H
External Interrupt 2	CC10IR	CC10IE	CC10INT	$00'0068_H$	$1A_H$

SSC Receive	SCRIR	SCRIE	SCRINT	$00'00B8_H$	$2E_H$
SSC Error	SCEIR	SCEIE	SCEINT	$00'00BC_H$	$2F_H$

*Note: The shaded interrupt nodes are **only available in the C161O**, not in the C161K.*

The C161K/O also provides an excellent mechanism to identify and to process exceptions or error conditions that arise during run-time, so-called ‘Hardware Traps’. Hardware traps cause immediate non-maskable system reaction which is similar to a standard interrupt service (branching to a dedicated vector table location). The occurrence of a hardware trap is additionally signified by an individual bit in the trap flag register (TFR). Except when another higher prioritized trap service is in progress, a hardware trap will interrupt any actual program execution. In turn, hardware trap services can normally not be interrupted by standard or PEC interrupts.

Table 4 shows all of the possible exceptions or error conditions that can arise during run-time:

Table 4 Hardware Trap Summary

Exception Condition	Trap Flag	Trap Vector	Vector Location	Trap Number	Trap Priority
Reset Functions: – Hardware Reset – Software Reset – W-dog Timer Overflow	–	 RESET RESET RESET	 $00'0000_H$ $00'0000_H$ $00'0000_H$	 00_H 00_H 00_H	 III III III

$\overline{\text{RD}}/\overline{\text{WR}}$ active current[7)]	I_{RWL}[6)]	-500	–	µA	$V_{OUT} = V_{OLmax}$
ALE inactive current[7)]	I_{ALEL}[5)]	–	40	µA	$V_{OUT} = V_{OLmax}$
ALE active current[7)]	I_{ALEH}[6)]	500	–	µA	V_{OUT} = 2.4 V
Port 6 inactive current[7)]	I_{P6H}[5)]	–	-40	µA	V_{OUT} = 2.4 V
Port 6 active current[7)]	I_{P6L}[6)]	-500	–	µA	$V_{OUT} = V_{OL1max}$
PORT0 configuration current[7)]	I_{P0H}[5)]	–	-10	µA	$V_{IN} = V_{IHmin}$
	I_{P0L}[6)]	-100	–	µA	$V_{IN} = V_{ILmax}$
XTAL1 input current	I_{IL} CC	–	±20	µA	0 V < V_{IN} < V_{DD}
Pin capacitance[8)] (digital inputs/outputs)	C_{IO} CC	–	10	pF	f = 1 MHz T_A = 25 °C

1) Keeping signal levels within the levels specified in this table, ensures operation without overload conditions. For signal levels outside these specifications also refer to the specification of the overload current I_{OV}.

2) Valid in bidirectional reset mode only.

3) This specification is not valid for outputs which are switched to open drain mode. In this case the respective output will float and the voltage results from the external circuitry.

4) These parameters describe the $\overline{\text{RSTIN}}$ pullup, which equals a resistance of ca. 50 to 250 kΩ.

5) The maximum current may be drawn while the respective signal line remains inactive.

6) The minimum current must be drawn in order to drive the respective signal line active.

7) This specification is valid during Reset and during Adapt-mode.

8) Not 100% tested, guaranteed by design and characterization.

Table 9 C161K/O Clock Generation Modes

CLKCFG (P0H.7-5)	CPU Frequency $f_{CPU} = f_{OSC} \times F$	External Clock Input Range	Notes
0 X X	$f_{OSC} \times 1$	1 to 25 MHz	Direct drive[1)]
1 X X	f_{OSC} / 2	2 to 50 MHz	CPU clock via prescaler

1) The maximum frequency depends on the duty cycle of the external clock signal.

Prescaler Operation

When prescaler operation is configured (CLKCFG = $1XX_B$) the CPU clock is derived from the internal oscillator (input clock signal) by a 2:1 prescaler.
The frequency of f_{CPU} is half the frequency of f_{OSC} and the high and low time of f_{CPU} (i.e. the duration of an individual TCL) is defined by the period of the input clock f_{OSC}.

The timings listed in the AC Characteristics that refer to TCLs therefore can be calculated using the period of f_{OSC} for any TCL.

Direct Drive

When direct drive is configured (CLKCFG = $0XX_B$) the CPU clock is directly driven from the internal oscillator with the input clock signal.
The frequency of f_{CPU} directly follows the frequency of f_{OSC} so the high and low time of f_{CPU} (i.e. the duration of an individual TCL) is defined by the duty cycle of the input clock f_{OSC}.
The timings listed below that refer to TCLs therefore must be calculated using the minimum TCL that is possible under the respective circumstances. This minimum value can be calculated via the following formula:

$$TCL_{min} = 1/f_{OSC} \times DC_{min} \qquad \text{(DC = duty cycle)}$$

For two consecutive TCLs the deviation caused by the duty cycle of f_{OSC} is compensated so the duration of 2TCL is always $1/f_{OSC}$. The minimum value TCL_{min} therefore has to be used only once for timings that require an odd number of TCLs (1, 3, …). Timings that require an even number of TCLs (2, 4, …) may use the formula $2TCL = 1/f_{OSC}$.

Memory Cycle Variables

The timing tables below use three variables which are derived from the BUSCONx registers and represent the special characteristics of the programmed memory cycle. The following table describes, how these variables are to be computed.

Table 12 Memory Cycle Variables

Description	Symbol	Values
ALE Extension	t_A	TCL × <ALECTL>
Memory Cycle Time Waitstates	t_C	2TCL × (15 - <MCTC>)
Memory Tristate Time	t_F	2TCL × (1 - <MTTC>)

Note: Please respect the maximum operating frequency of the respective derivative.

AC Characteristics

Multiplexed Bus (Standard Supply Voltage Range)
(Operating Conditions apply)
ALE cycle time = 6 TCL + $2t_A + t_C + t_F$ (120 ns at 25 MHz CPU clock without waitstates)

Parameter	Symbol		Max. CPU Clock = 25 MHz		Variable CPU Clock 1 / 2TCL = 1 to 25 MHz		Unit
			min.	max.	min.	max.	
ALE high time	t_5	CC	10 + t_A	–	TCL - 10 + t_A	–	ns
Address setup to ALE	t_6	CC	4 + t_A	–	TCL - 16 + t_A	–	ns
Address hold after ALE	t_7	CC	10 + t_A	–	TCL - 10 + t_A	–	ns

Data valid to $\overline{WR}$	t_{22}	CC	24 + t_C	–	2TCL - 26 + t_C	–	ns
Data hold after $\overline{WR}$	t_{24}	CC	15 + t_F	–	TCL - 10 + t_F	–	ns
ALE rising edge after $\overline{RD}$, $\overline{WR}$	t_{26}	CC	-12 + t_F	–	-12 + t_F	–	ns
Address hold after $\overline{WR}$[2]	t_{28}	CC	0 + t_F	–	0 + t_F	–	ns
ALE falling edge to $\overline{CS}$[3]	t_{38}	CC	-8 - t_A	10 - t_A	-8 - t_A	10 - t_A	ns
$\overline{CS}$ low to Valid Data In[3]	t_{39}	SR	–	47 + t_C + $2t_A$	–	3TCL - 28 + t_C + $2t_A$	ns
$\overline{CS}$ hold after $\overline{RD}$, $\overline{WR}$[3]	t_{41}	CC	9 + t_F	–	TCL - 16 + t_F	–	ns
ALE falling edge to $\overline{RdCS}$, $\overline{WrCS}$ (with RW-delay)	t_{42}	CC	19 + t_A	–	TCL - 6 + t_A	–	ns
ALE falling edge to $\overline{RdCS}$, $\overline{WrCS}$ (no RW-delay)	t_{43}	CC	-6 + t_A	–	-6 + t_A	–	ns
$\overline{RdCS}$ to Valid Data In (with RW-delay)	t_{46}	SR	–	20 + t_C	–	2TCL - 30 + t_C	ns
$\overline{RdCS}$ to Valid Data In (no RW-delay)	t_{47}	SR	–	45 + t_C	–	3TCL - 30 + t_C	ns
$\overline{RdCS}$, $\overline{WrCS}$ Low Time (with RW-delay)	t_{48}	CC	38 + t_C	–	2TCL - 12 + t_C	–	ns
$\overline{RdCS}$, $\overline{WrCS}$ Low Time (no RW-delay)	t_{49}	CC	63 + t_C	–	3TCL - 12 + t_C	–	ns
Data valid to $\overline{WrCS}$	t_{50}	CC	28 + t_C	–	2TCL - 22 + t_C	–	ns
Data hold after $\overline{RdCS}$	t_{51}	SR	0	–	0	–	ns

Demultiplexed Bus (Reduced Supply Voltage Range) (cont'd)
(Operating Conditions apply)
ALE cycle time = 4 TCL + 2t_A + t_C + t_F (100 ns at 20 MHz CPU clock without waitstates)

Parameter	Symbol		Max. CPU Clock = 20 MHz		Variable CPU Clock 1 / 2TCL = 1 to 20 MHz		Unit
			min.	max.	min.	max.	
Data float after $\overline{\text{RdCS}}$ (with RW-delay)[1]	t_{53}	SR	–	30 + t_F	–	2TCL - 20 + 2t_A + t_F [1]	ns
Data float after $\overline{\text{RdCS}}$ (no RW-delay)[1]	t_{68}	SR	–	5 + t_F	–	TCL - 20 + 2t_A + t_F [1]	ns
Address hold after $\overline{\text{RdCS}}$, $\overline{\text{WrCS}}$	t_{55}	CC	-16 + t_F	–	-16 + t_F	–	ns
Data hold after $\overline{\text{WrCS}}$	t_{57}	CC	9 + t_F	–	TCL - 16 + t_F	–	ns

1) RW-delay and t_A refer to the next following bus cycle (including an access to an on-chip X-Peripheral).

2) Read data are latched with the same clock edge that triggers the address change and the rising $\overline{\text{RD}}$ edge. Therefore address changes before the end of $\overline{\text{RD}}$ have no impact on read cycles.

3) These parameters refer to the latched chip select signals ($\overline{\text{CSxL}}$). The early chip select signals ($\overline{\text{CSxE}}$) are specified together with the address and signal $\overline{\text{BHE}}$ (see figures below).

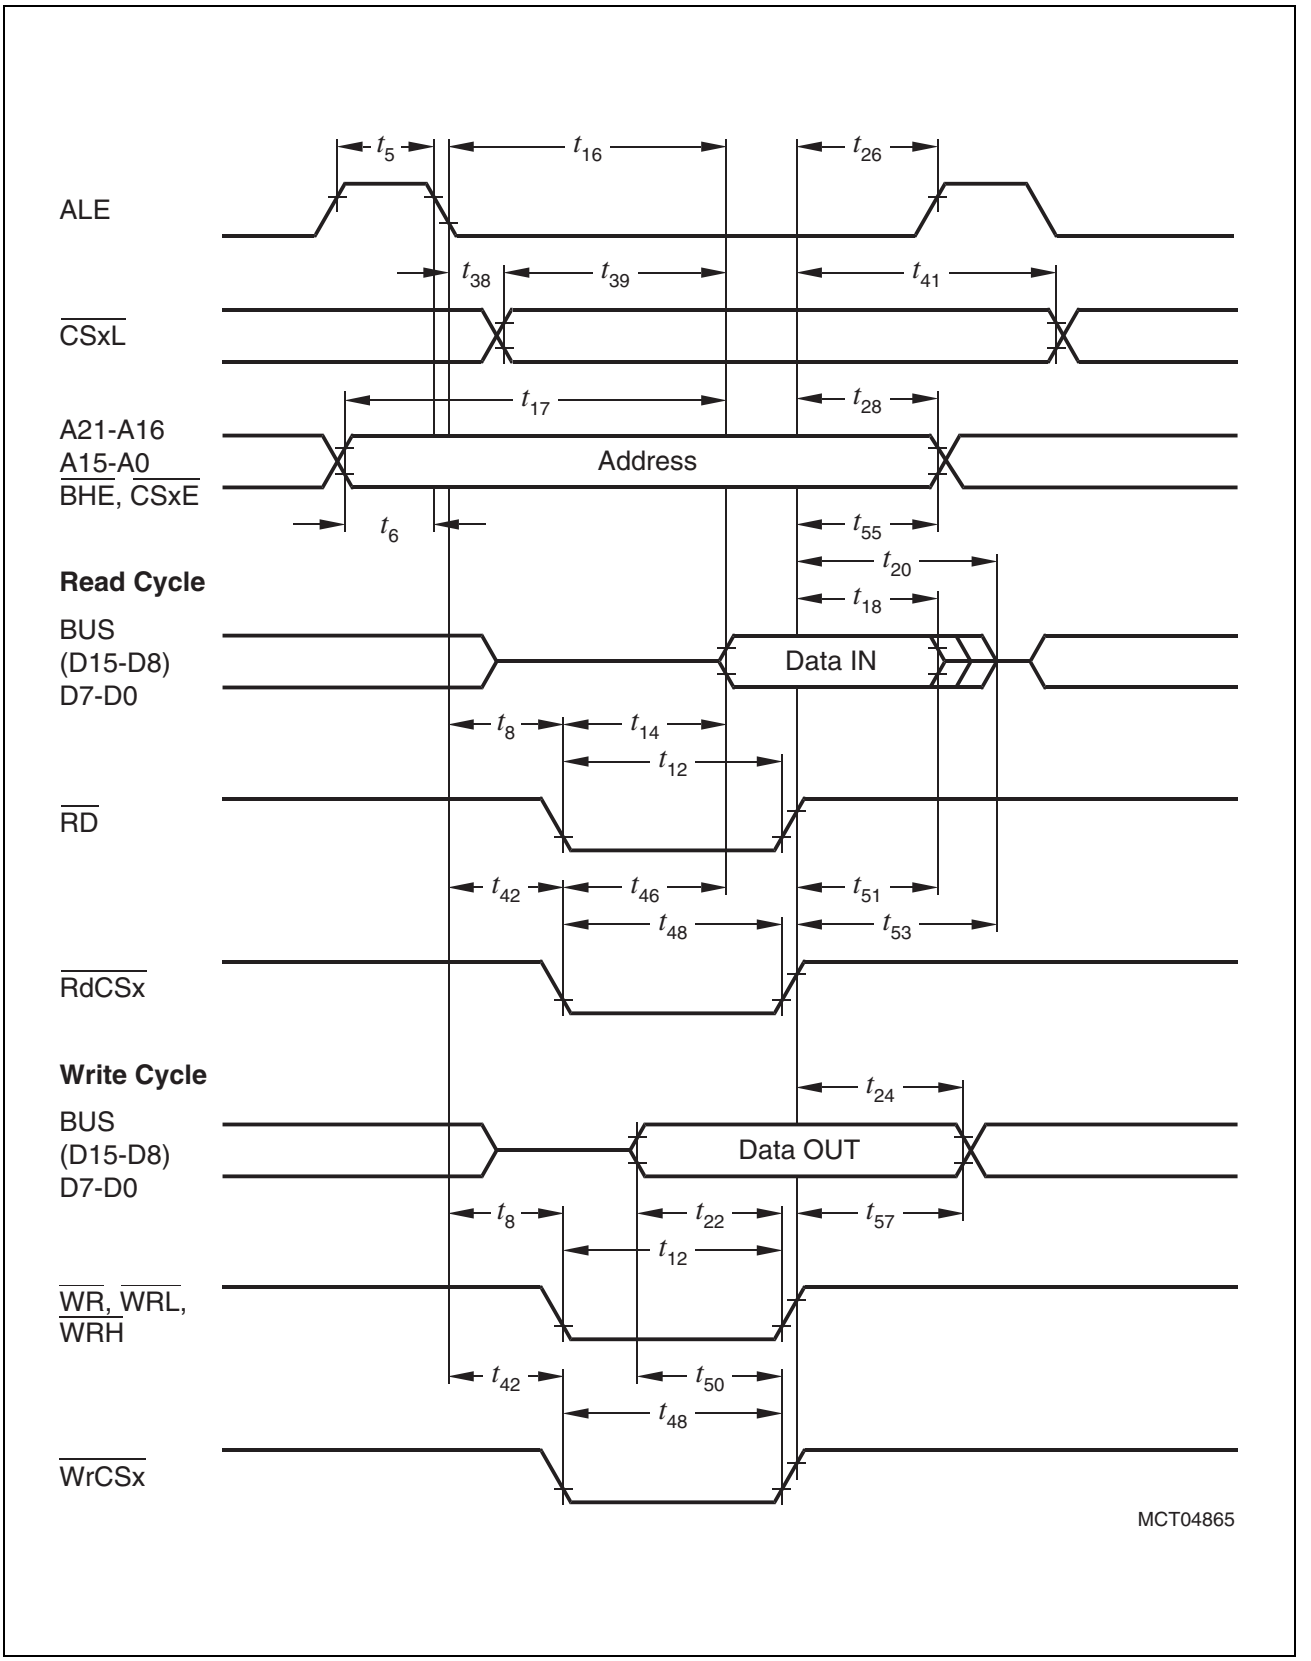

Figure 16 External Memory Cycle: Demultiplexed Bus, With Read/Write Delay, Normal ALE

Infineon goes for Business Excellence

“Business excellence means intelligent approaches and clearly defined processes, which are both constantly under review and ultimately lead to good operating results.
Better operating results and business excellence mean less idleness and wastefulness for all of us, more professional success, more accurate information, a better overview and, thereby, less frustration and more satisfaction.”

Dr. Ulrich Schumacher
