Embedded - Microcontrollers - Application Specific: Tailored Solutions for Precision and Performance

Embedded - Microcontrollers - Application Specific represents a category of microcontrollers designed with unique features and capabilities tailored to specific application needs. Unlike general-purpose microcontrollers, application-specific microcontrollers are optimized for particular tasks, offering enhanced performance, efficiency, and functionality to meet the demands of specialized applications.

What Are Embedded - Microcontrollers - Application Specific?

Application specific microcontrollers are engineered to

Details

Product Status	Obsolete
Applications	USB Host/Function Processor
Core Processor	-
Program Memory Type	-
Controller Series	AT43USB
RAM Size	-
Interface	USB
Number of I/O	32
Voltage - Supply	-
Operating Temperature	-40°C ~ 85°C
Mounting Type	Surface Mount
Package / Case	64-LQFP
Supplier Device Package	64-LQFP (10x10)
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/at43usb380e-au

Description

The AT43USB380 is a straightforward upgrade of the AT43USB370 Host/Function Processor to support the USB 2.0 On-The-Go (OTG) specification. It can operate either as a single-chip Host/Function Processor or if used in conjunction with an external Atmel Charge Pump, as a full OTG solution.

The AT43USB380 is functionally equivalent to the AT43USB370 as a Host/Function Processor and can be used in place of the AT43USB370 in the existing AT43USB370 design with minor hardware modifications. The pinout differences between the AT43USB370 and the AT43USB380 are due to the inclusion of the on-chip OTG interface in the AT43USB380.

To support OTG functionality, an external Charge Pump has to be connected to the OTG interface of the AT43USB380, as shown in Figure 1 on page 7. The external Charge Pump serves in the following two capacities:

1. As a power source to the downstream USB devices.
2. As a signaling interface during the OTG session negotiation upon connection.

From the hardware standpoint, the AT43USB380 is equivalent to the AT43USB370 with the following exceptions:

- **On-chip OTG Interface.** This hardware block is added to the AT43USB380 to support the OTG functionality. Signals in the OTG interface include ID, DISCHARGE, PUMP, CONTROL, EN, SESS_VLD, SESS_END, SESS_HIGH and SESS_LOW. This interface is used during an OTG session to determine the roles of the AT43USB380 and the connected OTG-enabled USB device either as a host or a function.
- **8/16/32 Bit Generic Host Processor Interface.** The AT43USB380 has a variable width, generic host processor interface whereas the AT43USB370 supports only 32-bit host interface. The width of the host interface on the AT43USB380 is determined by firmware configuration.
- **Simplified System Interface.** The GPIOs required in AT43USB370 for handshaking are no longer required in AT43USB380. The system processor can write directly to the AT43USB380 registers thus eliminates the need for PROG, SEL, READY, DONE, MORE, INTR_IN signals. The WAIT_N signal is not needed either. It is only there for precaution for SYS_CLK synchronization.
- **Up to 16 GPIO Pins.** GPIO pins are multiplexed with the host processor interface. When the interface to the host processor is 8 or 16 bits, up to 16 of the unused pins in the host processor interface can be used as GPIO pins. High level APIs are provided to access these GPIO pins.

From the standpoint of the firmware development environment, the AT43USB380 shares the same high level APIs and low level firmware libraries with the AT43USB370. Additions to the AT43USB380 firmware suite include:

- High level APIs specific to the OTG support. The number of additional APIs is less than 10.
- Low level OTG firmware embedded in the AT43USB380 hardware that support Host Negotiation Protocol (HNP) and Session Request Protocol (SRP).

The AT43USB380 share the same debugging tools with the AT43USB370 as well. During development, the AT43USB380 should be treated as a black box in terms of

On-The-Go Upgrade of the AT43USB370 USB 2.0 Full-Speed Host/Function Processor

AT43USB380

Upgrade Map Summary

Note: This is a summary document. A complete document is not available at this time. For more information, please contact your local Atmel sales office.

USB functionality. Communication with the AT43USB380 is achieved through a small set (less than 25) of high level, ANSI C-compliant APIs. The actual USB protocol including HNP and SRP is transparent to the host processor.

AT43USB380 OTG Processor Pin Description

Table 1 gives the description of the pins.

Table 1. Pin Description of the AT43USB380

Signal Name	Dir.	Polarity	Width	Description
System Interface				
SYS_CLK	I		1	Host system clock input for synchronization of WAIT_N and DREQ_N. (Synchronization requirement can be enable/disable through internal register settings)
A[7:0]	I		8	System Address Bus
CS_N	I	LO	1	CHIP_SELECT signal from System (ARM®)
D[15:0]	B		16	System Data Bus [15:0]
D[31:16]/ GPIO[15:0]	B		16	BWIDTH[1:0]=1x : System Data Bus [31:16] BWIDTH[1:0]=0x : GPIO[15:0]
DACK_N	I	LO	1	DMA Acknowledge from System (ARM)
DREQ_N	O	LO	1	DMA Request to System (ARM)
INTR_OUT	O	HI	1	Interrupt to System (ARM)
OE_N	I	LO	1	OUTPUT_ENABLE from System (ARM)
WAIT_N	O	LO	1	WAIT to System (ARM)
WE_N	I	LO	1	WRITE_ENABLE from System (ARM)
BWIDTH[1:0]	I		2	System Data Bus Size: 00 : 8 Bit Interface D[7:0] 01 : 16 Bit Interface D[15:0] 1x : 32 Bit Interface D[31:0]
WAKEUP_N	I	LO	1	Wakeup Request from System
USB Interface				
DM	B		1	USB Line (D-)
DP	B		1	USB Line (D+)
ID	I		1	OTG device type identification; used to differentiate a Mini-A and Mini-B plug
RPU_EN	O		1	Enable resistive pull-up to the D+ line
RPD_EN	O		1	Enable resistive pull-down to the D+/D- lines
Charge Pump Interface				
CPClk	O		1	Charge Pump clock output
EN	O		1	Charge Pump; Enable for Charge Pump
PUMP_EN	O		1	Charge Pump; Enable for Charge Pump

Table 1. Pin Description of the AT43USB380 (Continued)

Signal Name	Dir.	Polarity	Width	Description
SESS_VLD	I		1	Charge Pump; Active high when VBUS > VSESS_VLD otherwise "0"
SESS_END	I		1	Charge Pump; Active high when VBUS > VSESS_END otherwise "0"
SESS_LOW	I		1	Charge Pump; Active high when VBUS > VSESS_LOW otherwise "0"
SESS_HIGH	I		1	Charge Pump; Active high when VBUS > VSESS_HIGH otherwise "0"
LOW_CUR	O		1	Limits the current output of the Charge Pump. Used during VBUS pulsing when configured as B-device
DISCHARGE	O		1	Charge Pump; Connect VBUS to ground
Oscillator, Clocks				
XTAL1	I		1	Oscillator input
XTAL2	O		1	Oscillator output
LFT	I		1	PLL loop filter
CLK_SEL	I		1	Clock Source selection between crystal and external oscillator
RESET_N	I	LO	1	RESET for USB Processor
Jtag Interface				
TCK/SI	I		1	TP3=0: JTAG Clock - from JTAG controller; TP3=1: SI-EEPROM
TDI/SCK	I		1	TP3=0: JTAG Serial Data IN - from JTAG controller; TP3=1: SCK-EEPROM
TDO/SO	O		1	TP3=0: JTAG Serial Data OUT - from JTAG controller; TP3=1: SO-EEPROM
TMS/CS	I		1	TP3=0: JTAG Mode Select - from JTAG controller; TP3=1: CS-EEPROM
TRST_N	I	LO	1	JTAG Reset - from JTAG controller
Test Pins				
TP0	I		1	Test pin 0
TP1	I		1	Test Pin 1
TP2	I		1	Test pin 2
TP3	I		1	Test pin 3
TP4/SCAN_EN	I		1	Test pin 4/SCAN_EN
TP_CLK /D_CLK	O		1	Clock test output/SIE DPLL extracted clock
TP_RCV_DATA /RCV_DATA	O		1	Extracted serial data test output

Table 1. Pin Description of the AT43USB380 (Continued)

Signal Name	Dir.	Polarity	Width	Description
Power/Ground Pins				
VEXT18	O		3	1.8V regulated output
VDD	I		5	3.3V input
VSS			10	Ground
