Welcome to E-XFL.COM

Understanding Embedded - Microprocessors

Embedded microprocessors are specialized computing chips designed to perform specific tasks within an embedded system. Unlike general-purpose microprocessors found in personal computers, embedded microprocessors are tailored for dedicated functions within larger systems, offering optimized performance, efficiency, and reliability. These microprocessors are integral to the operation of countless electronic devices, providing the computational power necessary for controlling processes, handling data, and managing communications.

Applications of Embedded - Microprocessors

Embedded microprocessors are utilized across a broad spectrum of applications, making them indispensable in

Details	
Product Status	Obsolete
Core Processor	PowerPC 603e
Number of Cores/Bus Width	1 Core, 32-Bit
Speed	166MHz
Co-Processors/DSP	-
RAM Controllers	SDRAM
Graphics Acceleration	No
Display & Interface Controllers	-
Ethernet	-
SATA	-
USB	-
Voltage - I/O	3.3V
Operating Temperature	-40°C ~ 105°C (TA)
Security Features	-
Package / Case	357-BBGA
Supplier Device Package	357-PBGA (25x25)
Purchase URL	https://www.e-xfl.com/product-detail/nxp-semiconductors/mpc8241tvr166d

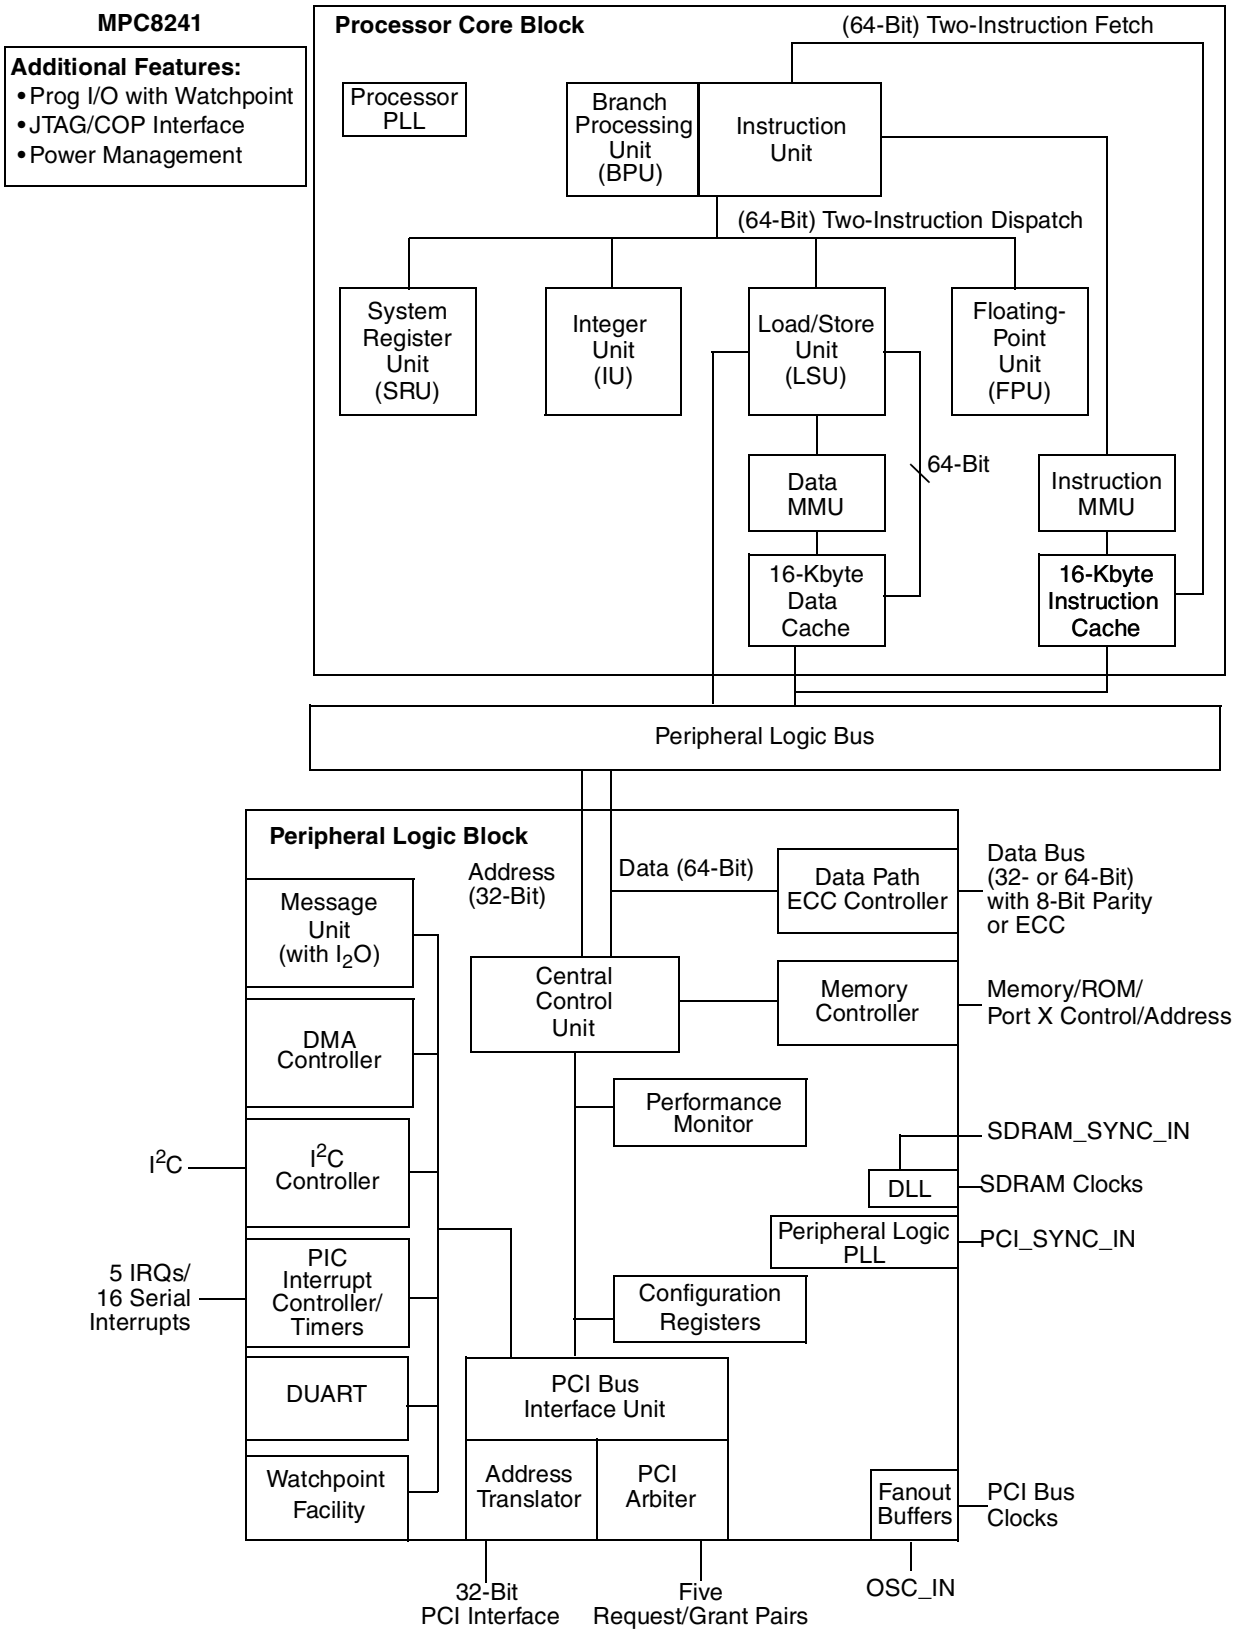

Figure 1. MPC8241 Block Diagram

4.1.2 Recommended Operating Conditions

Table 2 provides the recommended operating conditions for the MPC8241.

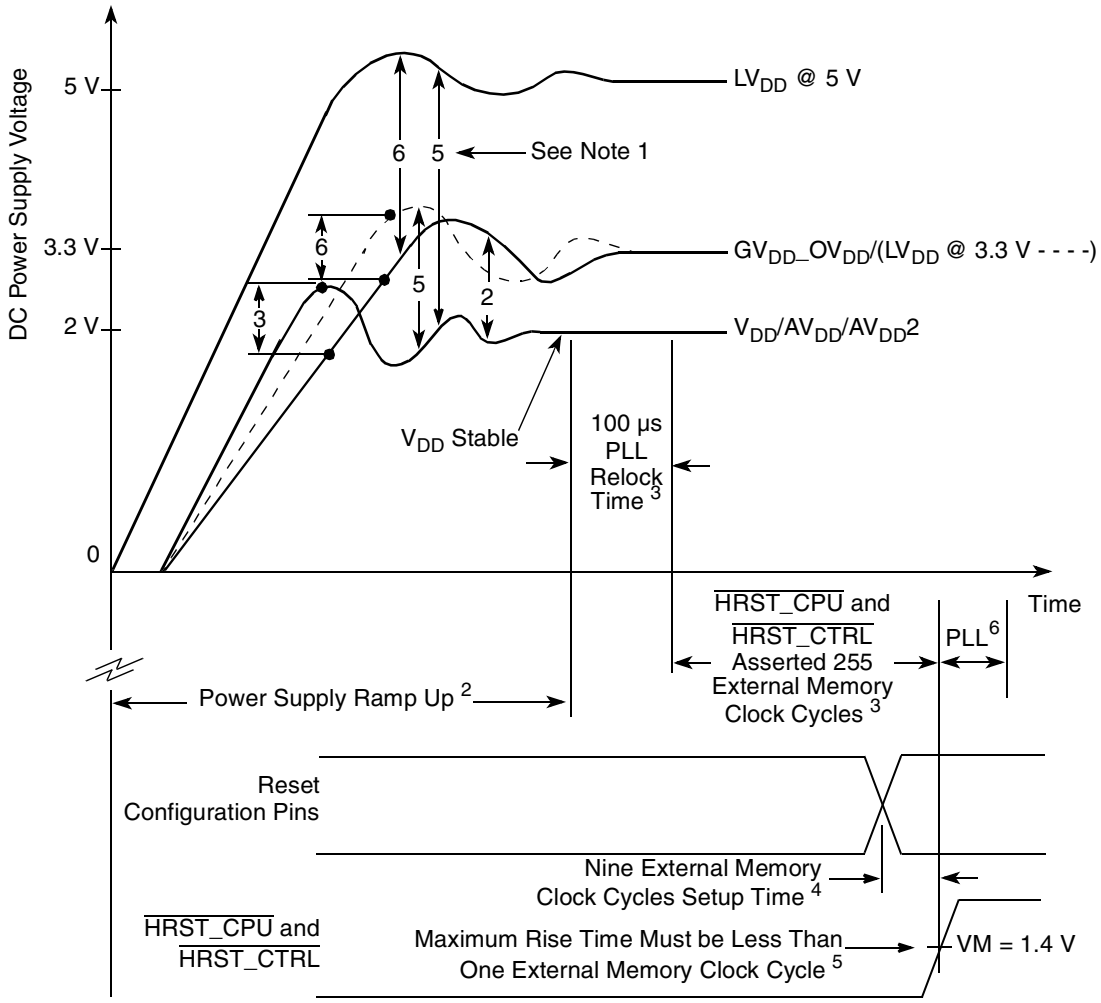
Table 2. Recommended Operating Conditions [1]

Characteristic		Symbol	Recommended Value	Unit	Notes
Supply voltage		V_{DD}	1.8 ± 100 mV	V	2
I/O buffer supply for PCI and standard; supply voltages for memory bus drivers		$GV_{DD}\_OV_{DD}$	3.3 ± 0.3	V	2
CPU PLL supply voltage		AV_{DD}	1.8 ± 100 mV		2
PLL supply voltage—peripheral logic		$AV_{DD}2$	1.8 ± 100 mV	V	2
PCI reference		LV_{DD}	5.0 ± 5%	V	4, 5, 6
			3.3 ± 0.3	V	5, 6, 7
Input voltage	PCI inputs	V_{in}	0 to 3.6 or 5.75	V	4, 7
	All other inputs		0 to 3.6	V	8
Die-junction temperature		T_j	0 to 105	•C	

Notes:

1. Freescale has tested these operating conditions and recommends them. Proper device operation outside of these conditions is not guaranteed.
2. **Caution:** $GV_{DD}\_OV_{DD}$ must not exceed $V_{DD}/AV_{DD}/AV_{DD}2$ by more than 1.8 V at any time including during power-on reset. Note that $GV_{DD}\_OV_{DD}$ pins are all shorted together: This limit may be exceeded for a maximum of 20 ms during power-on reset and power-down sequences. Connections should not be made to individual PWRRING pins.
3. **Caution:** $V_{DD}/AV_{DD}/AV_{DD}2$ must not exceed $GV_{DD}\_OV_{DD}$ by more than 0.6 V at any time, including during power-on reset. This limit may be exceeded for a maximum of 20 ms during power-on reset and power-down sequences.
4. PCI pins are designed to withstand LV_{DD} + 0.5 V DC when LV_{DD} is connected to a 5.0 V DC power supply.
5. **Caution:** LV_{DD} must not exceed $V_{DD}/AV_{DD}/AV_{DD}2$ by more than 5.4 V at any time, including during power-on reset. This limit may be exceeded for a maximum of 20 ms during power-on reset and power-down sequences.
6. **Caution:** LV_{DD} must not exceed $GV_{DD}\_OV_{DD}$ by more than 3.0 V at any time, including during power-on reset. This limit may be exceeded for a maximum of 20 ms during power-on reset and power-down sequences.
7. PCI pins are designed to withstand LV_{DD} + 0.5 V DC when LV_{DD} is connected to a 3.3 V DC power supply.
8. **Caution:** Input voltage (V_{in}) must not be greater than the supply voltage ($V_{DD}/AV_{DD}/AV_{DD}2$) by more than 2.5 V at all times including during power-on reset. Input voltage (V_{in}) must not be greater than $GV_{DD}\_OV_{DD}$ by more than 0.6 V at all times including during power-on reset.

Figure 2 shows supply voltage sequencing and separation cautions.



Notes:

1. Numbers associated with waveform separations correspond to caution numbers listed in Table 2.
2. See the Cautions section of Table 2 for details on this topic.
3. Refer to Table 8 for details on PLL relock and reset signal assertion timing requirements.
4. Refer to Table 10 for details on reset configuration pin setup timing requirements.
5. $\overline{\text{HRST\_CPU}}$/$\overline{\text{HRST\_CTRL}}$ must transition from a logic 0 to a logic 1 in less than one SDRAM_SYNC_IN clock cycle for the device to be in the nonreset state.
6. PLL_CFG signals must be driven on reset and must be held for at least 25 clock cycles after the negation of $\overline{\text{HRST\_CTRL}}$ and $\overline{\text{HRST\_CPU}}$ negate in order to be latched.

Figure 2. Supply Voltage Sequencing and Separation Cautions

Table 3. DC Electrical Specifications (continued)

Characteristics	Conditions	Symbol	Min	Max	Unit	Notes
Capacitance	V_{in} = 0 V, f = 1 MHz	C_{in}	—	16.0	pF	

Notes:
1. See Table 16 for pins with internal pull-up resistors.
2. All grounded pins are connected together.
3. Leakage current is measured on input and output pins in the high-impedance state. The leakage current is measured for nominal GV_{DD}_OV_{DD}/LV_{DD} and V_{DD} or both GV_{DD}_OV_{DD}/LV_{DD} and V_{DD} must vary in the same direction.
4. See Table 4 for the typical drive capability of a specific signal pin based on the type of output driver associated with that pin as listed in Table 16.

4.2.1 Output Driver Characteristics

Table 4 provides information on the characteristics of the output drivers referenced in Table 16. The values are preliminary estimates from an IBIS model and are not tested.

Table 4. Drive Capability of MPC8241 Output Pins [5, 6]

Driver Type	Programmable Output Impedance (Ω)	Supply Voltage	I_{OH}	I_{OL}	Unit	Notes
DRV_STD_MEM	20 (default)	GV_{DD}_OV_{DD} = 3.3 V	36.6	18.0	mA	2, 4
	40		18.6	9.2	mA	2, 4
DRV_PCI	20		12.0	12.4	mA	1, 3
	40 (default)		6.1	6.3	mA	1, 3
DRV_MEM_CTRL DRV_PCI_CLK DRV_MEM_CLK	6 (default)		89.0	42.3	mA	2, 4
	20		36.6	18.0	mA	2, 4
	40		18.6	9.2	mA	2, 4

Notes:
1. For DRV_PCI, I_{OH} read from the IBIS listing in the pull-up mode, I(Min) column, at the 0.33-V label by interpolating between the 0.3- and 0.4-V table entries current values which corresponds to the PCI V_{OH} = 2.97 = 0.9 × GV_{DD}_OV_{DD} (GV_{DD}_OV_{DD} = 3.3 V) where table entry voltage = GV_{DD}_OV_{DD} – PCI V_{OH}.
2. For all others with GV_{DD}_ OV_{DD} = 3.3 V, I_{OH} read from the IBIS listing in the pull-up mode, I(Min) column, at the 0.9-V table entry which corresponds to the V_{OH} = 2.4 V where table entry voltage = GV_{DD}_OV_{DD} – V_{OH}.
3. For DRV_PCI, I_{OL} read from the IBIS listing in the pull-down mode, I(Min) column, at 0.33 V = PCI V_{OL} = 0.1 × GV_{DD}_OV_{DD} (GV_{DD}_OV_{DD} = 3.3 V) by interpolating between the 0.3- and 0.4-V table entries.
4. For all others with GV_{DD}_OV_{DD} = 3.3 V, I_{OL} read from the IBIS listing in the pull-down mode, I(Min) column, at the 0.4-V table entry.
5. See driver bit details for output driver control register (0x73) in the *MPC8245 Integrated Processor Reference Manual*.
6. See Chip Errata No. 19 in the *MPC8245/MPC8241 Integrated Processor Chip Errata*.

Table 7 provides the operating frequency information for the MPC8241 at recommended operating conditions (see Table 2) with LV_{DD} = 3.3 V ± 0.3 V.

Table 7. Operating Frequency

Characteristic	166 MHz		200 MHz		266 MHz		Unit
	$V_{DD}/AV_{DD}/AV_{DD}2$ = 1.8 ± 100 mV						
	Min	Max	Min	Max	Min	Max	
Processor frequency (CPU)	100	166	100	200	100	266	MHz
Memory bus frequency	33	83	33	100	33	133	MHz
PCI input frequency	25–66						MHz

Caution: The PCI_SYNC_IN frequency and PLL_CFG[0:4] settings must be chosen such that the resulting peripheral logic/memory bus frequency and CPU (core) frequencies do not exceed their respective maximum or minimum operating frequencies. Refer to the PLL_CFG[0:4] signal description in Section 6, "PLL Configuration," for valid PLL_CFG[0:4] settings and PCI_SYNC_IN frequencies.

4.5.1 Clock AC Specifications

Table 8 provides the clock AC timing specifications at recommended operating conditions, as defined in Section 4.5.2, "Input AC Timing Specifications." These specifications are for the default driver strengths indicated in Table 4. Figure 6 shows the PCI_SYNC_IN input clock timing diagram with the labeled number items listed in Table 8.

Table 8. Clock AC Timing Specifications

At recommended operating conditions (see Table 2) with LV_{DD} = 3.3 V ± 0.3 V

Num	Characteristics and Conditions	Min	Max	Unit	Notes
1	Frequency of operation (PCI_SYNC_IN)	25	66	MHz	
2, 3	PCI_SYNC_IN rise and fall times	—	2.0	ns	1
4	PCI_SYNC_IN duty cycle measured at 1.4 V	40	60	%	
5a	PCI_SYNC_IN pulse width high measured at 1.4 V	6	9	ns	2
5b	PCI_SYNC_IN pulse width low measured at 1.4 V	6	9	ns	2
7	PCI_SYNC_IN jitter	—	200	ps	
8a	PCI_CLK[0:4] skew (pin-to-pin)	—	250	ps	
8b	SDRAM_CLK[0:3] skew (pin-to-pin)	—	190	ps	3
10	Internal PLL relock time	—	100	µs	2, 4, 5
15	DLL lock range with DLL_EXTEND = 0 (disabled) and normal tap delay; (default DLL mode)	See Figure 7		ns	6
16	DLL lock range for other modes	See Figure 8 through Figure 10		ns	6
17	Frequency of operation (OSC_IN)	25	66	MHz	
19	OSC_IN rise and fall times	—	5	ns	7
20	OSC_IN duty cycle measured at 1.4 V	40	60	%	

Table 8. Clock AC Timing Specifications (continued)

At recommended operating conditions (see Table 2) with LV_{DD} = 3.3 V ± 0.3 V

Num	Characteristics and Conditions	Min	Max	Unit	Notes
21	OSC_IN frequency stability	—	100	ppm	

Notes:

1. Rise and fall times for the PCI_SYNC_IN input are measured from 0.4 through 2.4 V.
2. Specification value at maximum frequency of operation.
3. Pin-to-pin skew includes quantifying the additional amount of clock skew (or jitter) from the DLL besides any intentional skew added to the clocking signals from the variable length DLL synchronization feedback loop, that is, the amount of variance between the internal *sys_logic_clk* and the SDRAM_SYNC_IN signal after the DLL is locked. While pin-to-pin skew between SDRAM_CLKs can be measured, the relationship between the internal *sys_logic_clk* and the external SDRAM_SYNC_IN cannot be measured and is guaranteed by design.
4. Relock time is guaranteed by design and characterization. Relock time is not tested.
5. Relock timing is guaranteed by design. PLL-relock time is the maximum amount of time required for PLL lock after a stable V_{DD} and PCI_SYNC_IN are reached during the reset sequence. This specification also applies when the PLL has been disabled and subsequently re-enabled during sleep mode. Also note that $\overline{\text{HRST\_CPU}}$/$\overline{\text{HRST\_CTRL}}$ must be held asserted for a minimum of 255 bus clocks after the PLL-relock time during the reset sequence.
6. DLL_EXTEND is bit 7 of the PMC2 register <72>. *N* is a non-zero integer (see Figure 7 through Figure 10). T_{clk} is the period of one SDRAM_SYNC_OUT clock cycle in ns. T_{loop} is the propagation delay of the DLL synchronization feedback loop (PC board runner) from SDRAM_SYNC_OUT to SDRAM_SYNC_IN in ns; 6.25 inches of loop length (unloaded PC board runner) corresponds to approximately 1 ns of delay. For details about how Figure 7 through Figure 10 may be used, refer to the Freescale application note AN2164, *MPC8245/MPC8241 Memory Clock Design Guidelines,* for details on MPC8241 memory clock design.
7. Rise and fall times for the OSC_IN input are guaranteed by design and characterization. OSC_IN input rise and fall times are not tested.

Figure 6 shows the PCI_SYNC_IN input clock timing diagram, and Figure 7 through Figure 10 show the DLL locking range loop delay versus frequency of operation.

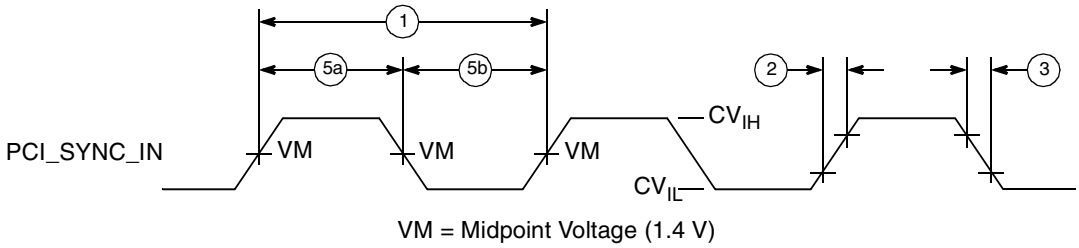


Figure 6. PCI_SYNC_IN Input Clock Timing Diagram

Register settings that define each DLL mode are shown in Table 9.

Table 9. DLL Mode Definition

DLL Mode	Bit 2 of Configuration Register at 0x76	Bit 7 of Configuration Register at 0x72
Normal tap delay, No DLL extend	0	0
Normal tap delay, DLL extend	0	1
Max tap delay, No DLL extend	1	0
Max tap delay, DLL extend	1	1

The DLL_MAX_DELAY bit can lengthen the amount of time through the delay line by increasing the time between each of the 128 tap points in the delay line. Although this increased time makes it easier to guarantee that the reference clock is within the DLL lock range, there may be slightly more jitter in the output clock of the DLL if the phase comparator shifts the clock between adjacent tap points. Refer to the Freescale application note AN2164, *MPC8245/MPC8241 Memory Clock Design Guidelines: Part 1*, for details on DLL modes and memory design.

The value of the current tap point after the DLL locks can be determined by reading bits 6–0 (DLL_TAP_COUNT) of the DLL tap count register (DTCR, located at offset 0xE3). These bits store the value (binary 0 through 127) of the current tap point and can indicate whether the DLL advances or decrements as it maintains the DLL lock. Therefore, for evaluation purposes, DTCR can be read for all DLL modes that support the T_{loop} value used for the trace length of SDRAM_SYNC_OUT to SDRAM_SYNC_IN. The DLL mode with the smallest tap point value in the DTCR should be used because the bigger the tap point value, the more jitter that can be expected for clock signals. Keeping a DLL mode locked below tap point decimal 12 is not recommended.

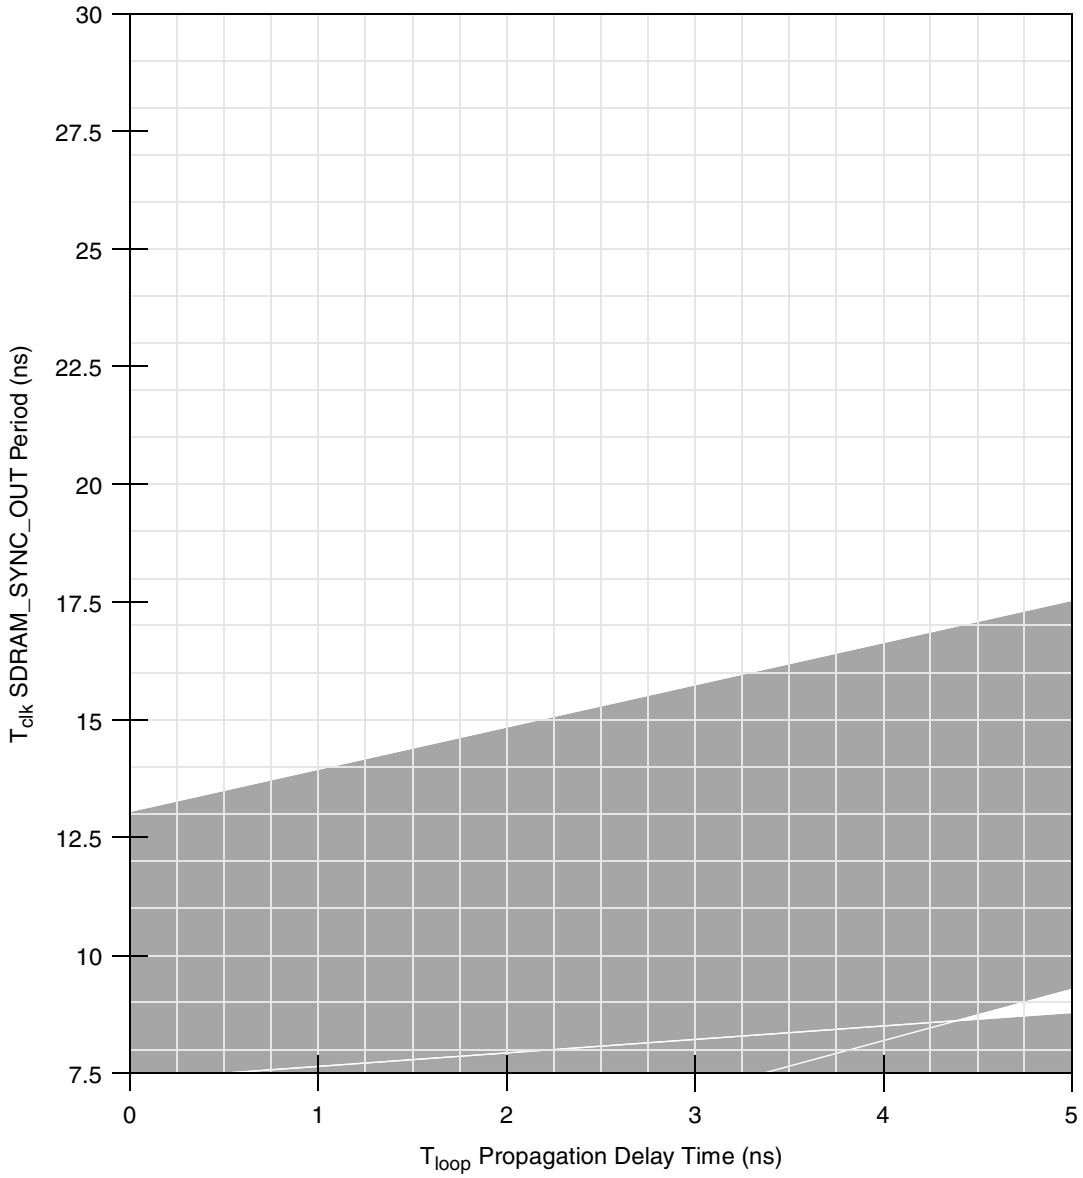

Figure 7. DLL Locking Range Loop Delay versus Frequency of Operation for DLL_Extend=0 and Normal Tap Delay

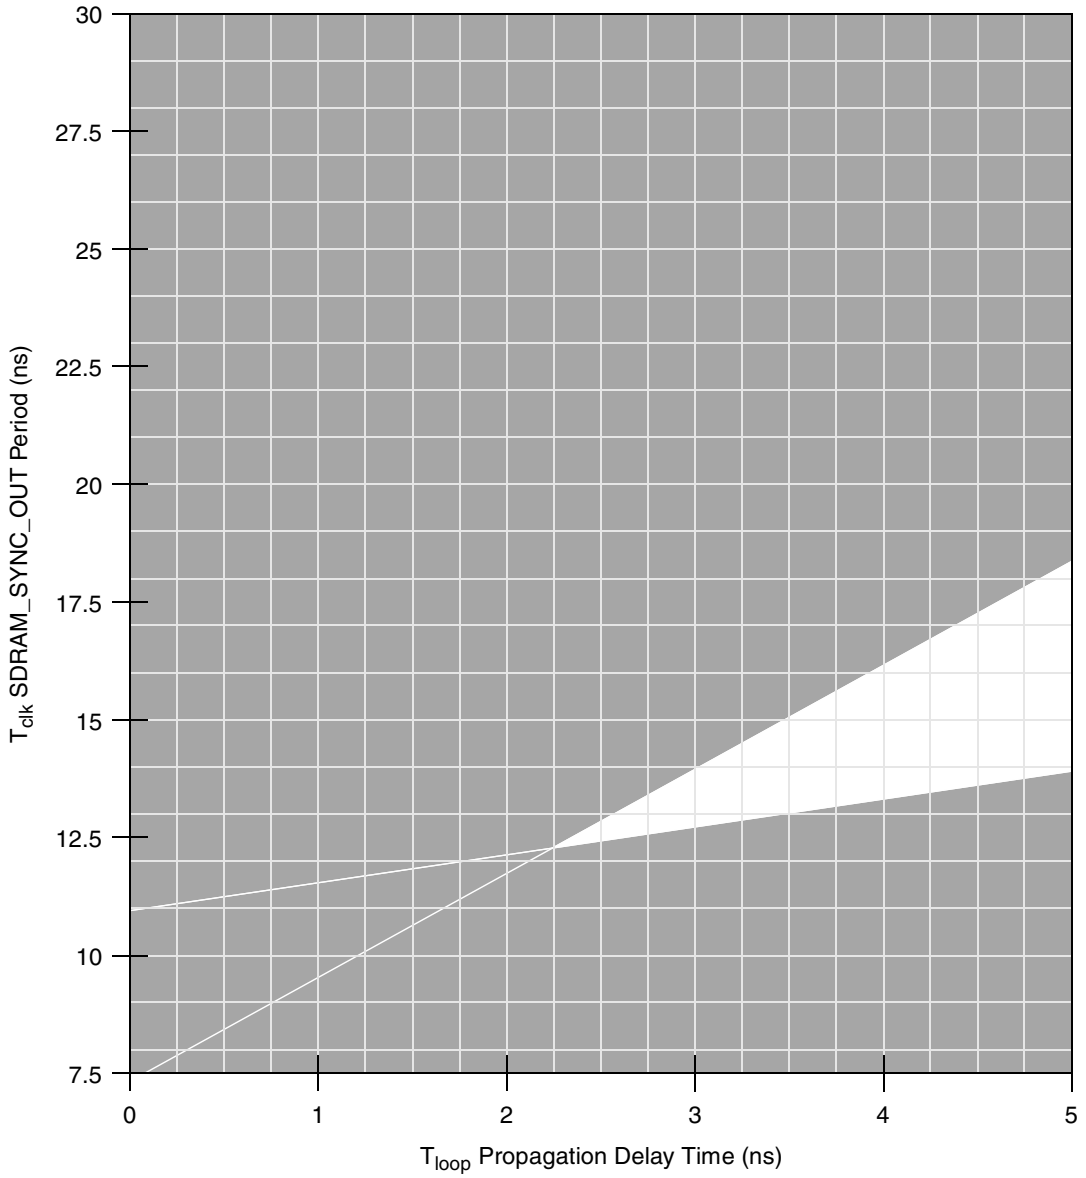

Figure 10. DLL Locking Range Loop Delay versus Frequency of Operation for DLL_Extend=1 and Max Tap Delay

4.5.2 Input AC Timing Specifications

Table 10 provides the input AC timing specifications at recommended operating conditions (see Table 2) with LV_{DD} = 3.3 V ± 0.3 V. See Figure 11 and Figure 12.

Table 10. Input AC Timing Specifications

Num	Characteristic	Min	Max	Unit	Notes
10a	PCI input signals valid to PCI_SYNC_IN (input setup)	3.0	—	ns	1, 3
10b	Memory input signals valid to *sys_logic_clk* (input setup)				

Table 11. Output AC Timing Specifications (continued)

Num	Characteristic	Min	Max	Unit	Notes
14b	*sys_logic_clk* to output high impedance (for all others)	—	4.0	ns	2

Notes:

1. All PCI signals are measured from $GV_{DD}\_OV_{DD}/2$ of the rising edge of PCI_SYNC_IN to $0.285 \times GV_{DD}\_OV_{DD}$ or $0.615 \times GV_{DD}\_OV_{DD}$ of the signal in question for 3.3 V PCI signaling levels. See Figure 12.
2. All memory and related interface output signal specifications are specified from the VM = 1.4 V of the rising edge of the memory bus clock, *sys_logic_clk* to the TTL level (0.8 or 2.0 V) of the signal in question. *sys_logic_clk* is the same as PCI_SYNC_IN in 1:1 mode, but is twice the frequency in 2:1 mode (processor/memory bus clock rising edges occur on every rising and falling edge of PCI_SYNC_IN). See Figure 11.
3. PCI bused signals are composed of the following signals: $\overline{\text{LOCK}}$, $\overline{\text{IRDY}}$, $\overline{\text{C/BE}}$[3:0], PAR, $\overline{\text{TRDY}}$, $\overline{\text{FRAME}}$, $\overline{\text{STOP}}$, $\overline{\text{DEVSEL}}$, $\overline{\text{PERR}}$, $\overline{\text{SERR}}$, AD[31:0], $\overline{\text{REQ}}$[4:0], $\overline{\text{GNT}}$[4:0], $\overline{\text{IDSEL}}$, and $\overline{\text{INTA}}$.
4. To meet minimum output hold specifications relative to PCI_SYNC_IN for both 33- and 66-MHz PCI systems, the MPC8241 has a programmable output hold delay for PCI signals (the PCI_SYNC_IN to output valid timing is also affected). The initial value of the output hold delay is determined by the values on the $\overline{\text{MCP}}$ and CKE reset configuration signals; the values on these two signals are inverted and subsequently stored as the initial settings of PCI_HOLD_DEL = PMCR2[5, 4] (power management configuration register 2 <0x72>), respectively. Because $\overline{\text{MCP}}$ and CKE have internal pull-up resistors, the default value of PCI_HOLD_DEL after reset is 0b00. Additional output hold delay values are available by programming the PCI_HOLD_DEL value of the PMCR2 configuration register. See Figure 15 for PCI_HOLD_DEL effect on output valid and hold time.

Figure 14 provides the AC test load for the MPC8241.

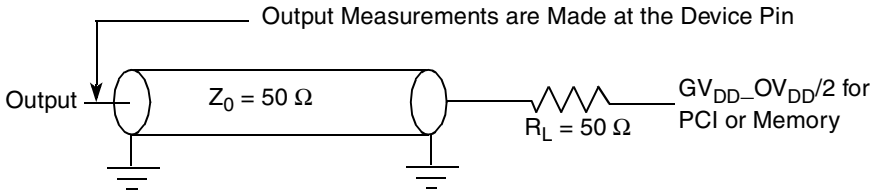

Figure 14. AC Test Load for the MPC8241

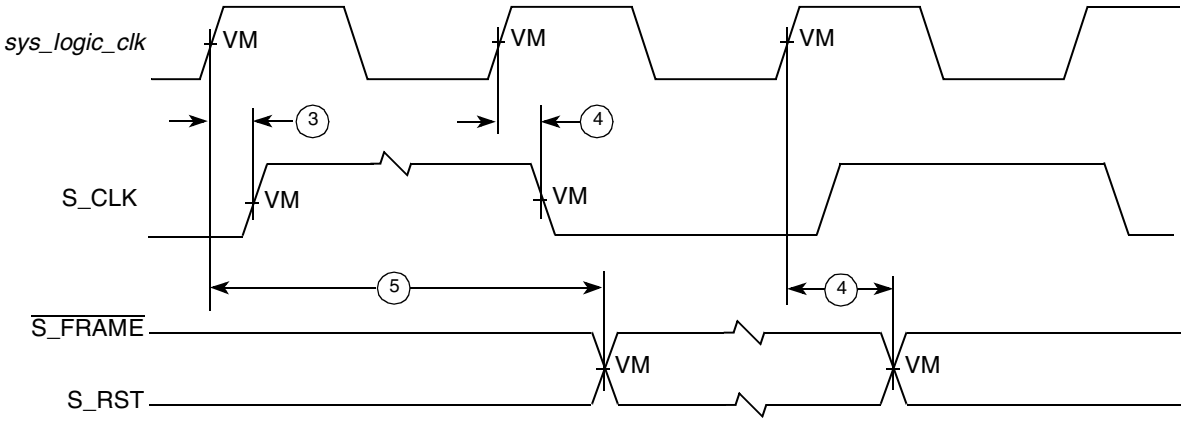

Figure 18. PIC Serial Interrupt Mode Output Timing Diagram

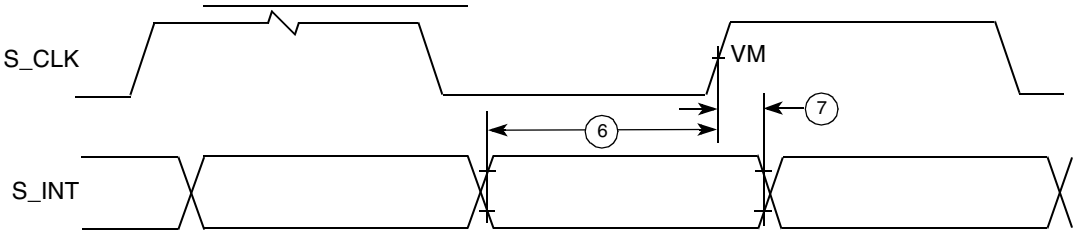

Figure 19. PIC Serial Interrupt Mode Input Timing Diagram

4.7.1 IEEE 1149.1 (JTAG) AC Timing Specifications

Table 15 provides the JTAG AC timing specifications for the MPC8241 while in the JTAG operating mode at recommended operating conditions (see Table 2) with LV_{DD} = 3.3 V ± 0.3 V. Timings are independent of the system clock (PCI_SYNC_IN).

Table 15. JTAG AC Timing Specification (Independent of PCI_SYNC_IN)

Num	Characteristic	Min	Max	Unit	Notes
	TCK frequency of operation	0	25	MHz	—
1	TCK cycle time	40	—	ns	—
2	TCK clock pulse width measured at 1.5 V	20	—	ns	—
3	TCK rise and fall times	0	3	ns	—
4	$\overline{\text{TRST}}$ setup time to TCK falling edge	10	—	ns	1
5	$\overline{\text{TRST}}$ assert time	10	—	ns	—
6	Input data setup time	5	—	ns	2
7	Input data hold time	15	—	ns	2
8	TCK to output data valid	0	30	ns	3
9	TCK to output high impedance	0	30	ns	3
10	TMS, TDI data setup time	5	—	ns	—

Table 15. JTAG AC Timing Specification (Independent of PCI_SYNC_IN)

Num	Characteristic	Min	Max	Unit	Notes
11	TMS, TDI data hold time	15	—	ns	—
12	TCK to TDO data valid	0	15	ns	—
13	TCK to TDO high impedance	0	15	ns	—

Notes:
1. $\overline{\text{TRST}}$ is an asynchronous signal. The setup time is for test purposes only.
2. Nontest (other than TDI and TMS) signal input timing with respect to TCK.
3. Nontest (other than TDO) signal output timing with respect to TCK.

Figure 20 through Figure 23 show the different timing diagrams for JTAG.

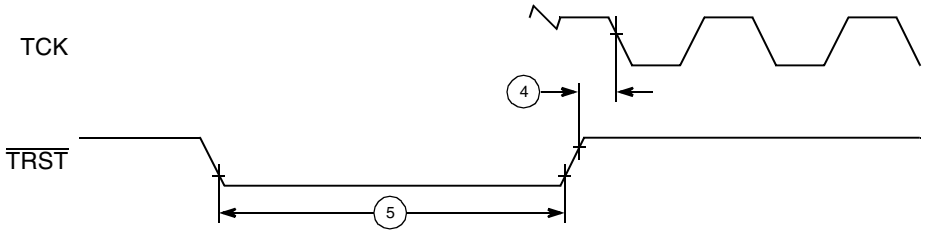

Figure 21. JTAG $\overline{\text{TRST}}$ Timing Diagram

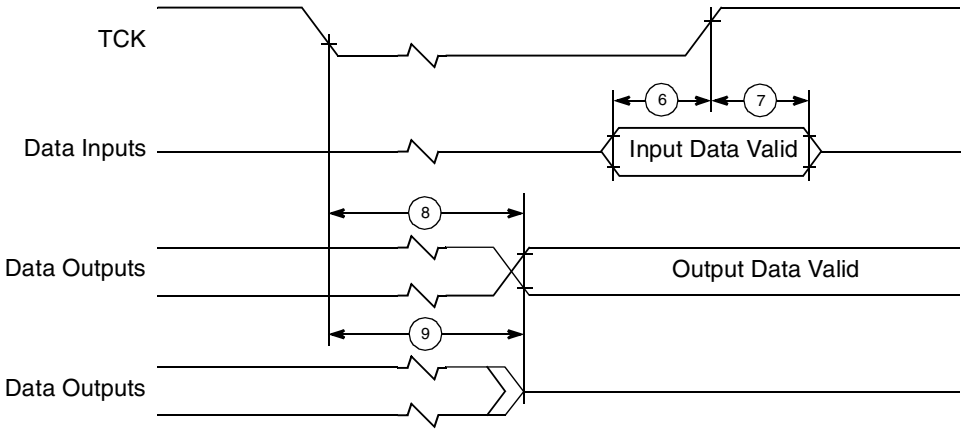

Figure 22. JTAG Boundary Scan Timing Diagram

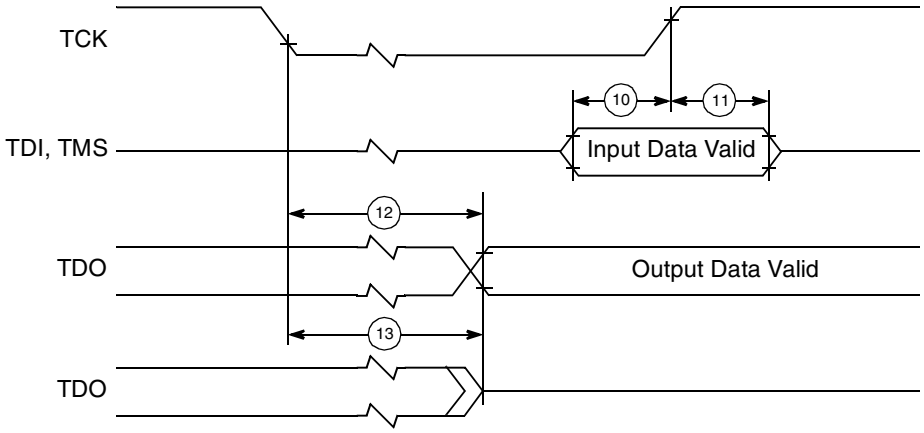

Figure 23. Test Access Port Timing Diagram

5 Package Description

This section details package parameters, pin assignments, and dimensions.

5.1 Package Parameters for the MPC8241

The MPC8241 uses a 25 mm × 25 mm, cavity up, 357-pin plastic ball grid array (PBGA) package. The package parameters are as follows.

Package outline	25 mm × 25 mm
Interconnects	357
Pitch	1.27 mm
Solder balls	ZP (PBGA)—62 Sn/36 Pb/2 Ag—available only in Rev B parts ZQ (Thick substrate thick mold cap PBGA)—62 Sn/36 Pb/2 Ag VR (Lead free version of package)—95.5 Sn/4.0 Ag/0.5 Cu
Solder ball diameter	0.75 mm
Maximum module height	2.52 mm
Co-planarity specification	0.15 mm
Maximum force	6.0 lbs. total, uniformly distributed over package (8 grams/ball)

5.3 Pinout Listings

Table 16 provides the pinout listing for the MPC8241, 357 PBGA package.

Table 16. MPC8241 Pinout Listing

Table 17. PLL Configurations (166- and 200-MHz) (continued)

Ref [2]	PLL_CFG [0:4] [1]	166 MHz-Part [2]			200-MHz Part [2]			Multipliers	
		PCI Clock Input (PCI_SYNC_IN) Range [3] (MHz)	Peripheral Logic/ Mem Bus Clock Range (MHz)	CPU Clock Range (MHz)	PCI Clock Input (PCI_SYNC_IN) Range [3] (MHz)	Peripheral Logic/ Mem Bus Clock Range (MHz)	CPU Clock Range (MHz)	PCI-to-Mem (Mem VCO)	Mem-to-CPU (CPU VCO)
1E	11110[14]	Not usable			Not usable			Off	Off
1F	11111[14]	Not usable			Not usable			Off	Off

Notes:

1. PLL_CFG[0:4] settings not listed are reserved. Bits 7–4 of register offset <0xE2> contain the PLL_CFG[0:4] setting value. Note the impact of the relevant revisions for mode 7.
2. Range values are shown rounded down to the nearest whole number (decimal place accuracy removed) for clarity.
3. Limited by maximum PCI input frequency (66 MHz).
4. Limited by minimum CPU VCO frequency (300 MHz).
5. Limited by maximum CPU operating frequency.
6. In PLL bypass mode, the PCI_SYNC_IN input signal clocks the internal processor directly, the peripheral logic PLL is disabled, and the bus mode is set for 1:1 (PCI:Mem) mode operation. This mode is intended for hardware modeling. The AC timing specifications in this document do not apply in PLL bypass mode.
7. Limited by minimum CPU operating frequency (100 MHz).
8. Limited due to maximum memory VCO frequency (352 MHz).
9. In dual PLL bypass mode, the PCI_SYNC_IN input signal clocks the internal peripheral logic directly, the peripheral logic PLL is disabled, and the bus mode is set for 1:1 (PCI_SYNC_IN:Mem) mode operation. In this mode, the OSC_IN input signal clocks the internal processor directly in 1:1 (OSC_IN:CPU) mode operation, and the processor PLL is disabled. The PCI_SYNC_IN and OSC_IN input clocks must be externally synchronized. This mode is intended for hardware modeling. The AC timing specifications in this document do not apply in dual PLL bypass mode.
10. Limited by maximum CPU VCO frequency (704 MHz).
11. Limited by maximum system memory interface operating frequency (83 MHz @ 166 MHz CPU bus speed).
12. Limited by maximum system memory interface operating frequency (100 MHz @ 200 MHz CPU bus speed).
13. Limited by minimum memory VCO frequency (132 MHz).
14. In clock off mode, no clocking occurs inside the MPC8241, regardless of the PCI_SYNC_IN input.

Table 18. PLL Configurations (266-MHz Parts)

Ref [2]	PLL_CFG[0:4] [10,11]	266-MHz Part [9]			Multipliers

7.7 Thermal Management

This section provides thermal management information for the plastic ball grid array (PBGA) package for air-cooled applications. Depending on the application environment and the operating frequency, a heat sink may be required to maintain junction temperature within specifications. Proper thermal control design primarily depends on the system-level design: heat sink, airflow, and thermal interface material. To reduce the die-junction temperature, heat sinks can be attached to the package by several methods: adhesive, spring clip to holes in the printed-circuit board or package, or mounting clip and screw assembly (see Figure 28).

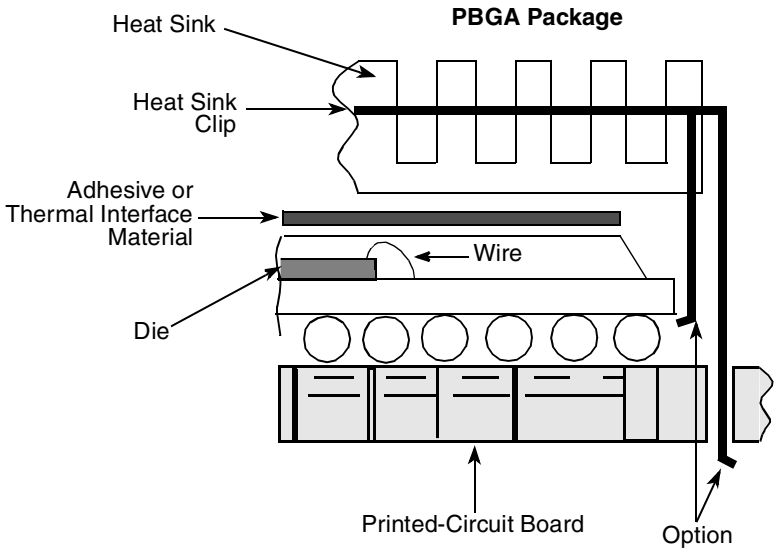

Figure 28. Package Exploded Cross-Sectional View with Several Heat Sink Options

Figure 29 depicts the die junction-to-ambient thermal resistance for four typical cases:

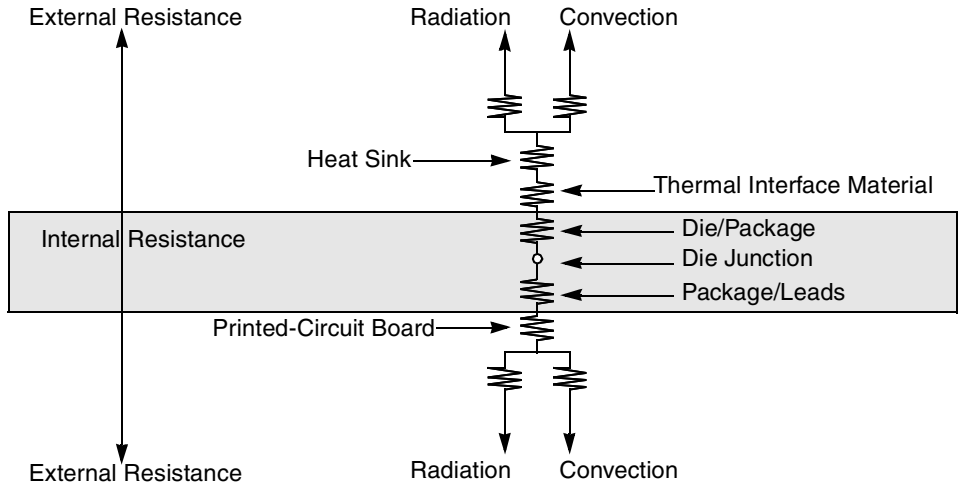
- A heat sink is not attached to the PBGA package and a high board-level thermal loading from adjacent components exists (label used—1s).
- A heat sink is not attached to the PBGA package and a low board-level thermal loading from adjacent components exists (label used—2s2p).
- A large heat sink (cross cut extrusion, $38 \times 38 \times 16.5$ mm) is attached to the PBGA package and a high board-level thermal loading from adjacent components exists (label used—1s/sink).
- A large heat sink (cross cut extrusion, $38 \times 38 \times 16.5$ mm) is attached to the PBGA package and a low board-level thermal loading from adjacent components exists (label used—2s2p/sink).

7.7.1 Internal Package Conduction Resistance

For the PBGA, die-up, packaging technology, shown in Figure 28, the intrinsic conduction thermal resistance paths are as follows:

- The die junction-to-case thermal resistance
- The die junction-to-ball thermal resistance

Figure 30 depicts the primary heat transfer path for a package with an attached heat sink mounted to a printed-circuit board.



(Note the internal versus external package resistance)

Figure 30. PBGA Package with Heat Sink Mounted to a Printed-Circuit Board

For this die-up, wire-bond PBGA package, heat generated on the active side of the chip is conducted mainly through the mold cap, the heat sink attach material (or thermal interface material), and finally through the heat sink where forced-air convection removes it.

7.7.2 Adhesives and Thermal Interface Materials

A thermal interface material should be used between the top of the mold cap and the bottom of the heat sink minimizes thermal contact resistance. For applications that attach the heat sink by a spring clip mechanism, Figure 31 shows the thermal performance of three thin-sheet thermal-interface materials (silicone, graphite/oil, floroether oil), a bare joint, and a joint with thermal grease as a function of contact pressure. As shown, the performance of these thermal interface materials improves with increasing contact pressure. Thermal grease significantly reduces the interface thermal resistance. That is, the bare joint offers a thermal resistance approximately seven times greater than the thermal grease joint.

A spring clip attaches heat sinks to holes in the printed-circuit board (see Figure 28). Therefore, the synthetic grease offers the best thermal performance, considering the low interface pressure. The selection of any thermal interface material depends on factors such as thermal performance requirements, manufacturability, service temperature, dielectric properties, and cost.

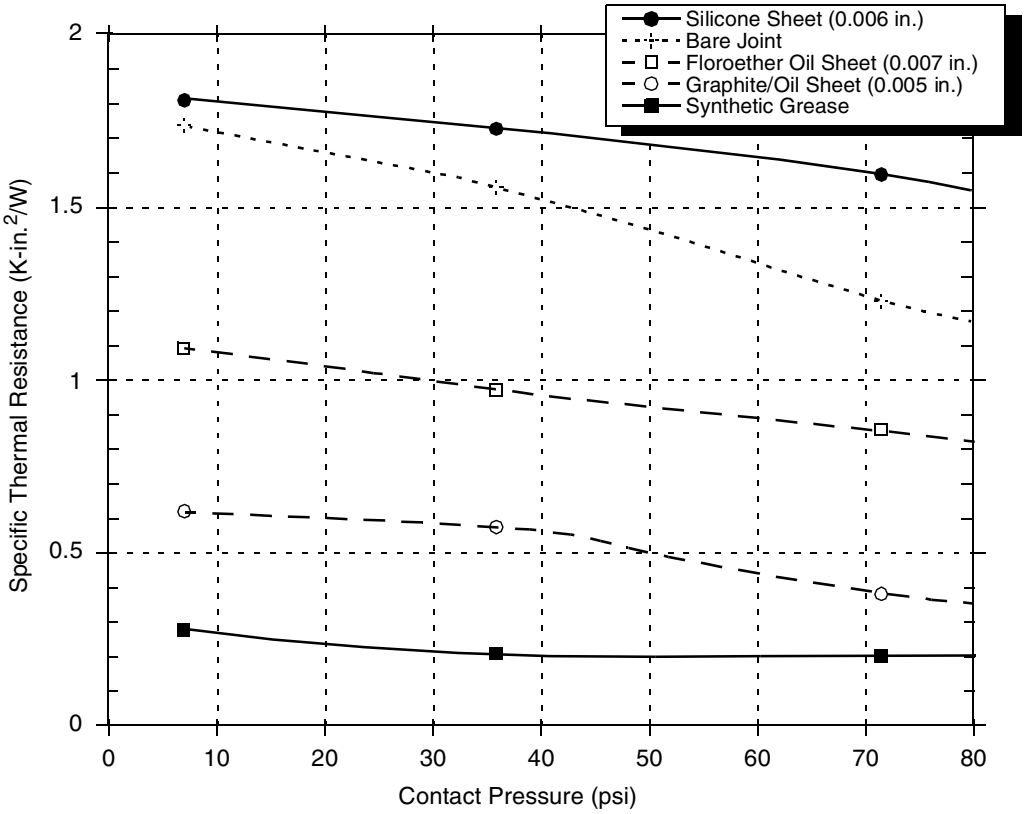


Figure 31. Thermal Performance of Select Thermal Interface Material

The board designer can choose among several types of thermal interface. Heat sink adhesive materials are selected on the basis of high conductivity and adequate mechanical strength to meet equipment shock/vibration requirements. Several commercially-available thermal interfaces and adhesive materials are provided by the following vendors:

The Bergquist Company 18930 West 78th St. Chanhassen, MN 55317 Internet: www.bergquistcompany.com	800-347-4572

Table 21. Revision History Table (continued)

Revision	Date	Substantive Change(s)
4	—	Section 1.4.1.2—Table 2: Changed note 1. Figure 2: Updated note 2 and removed 'voltage regulator delay' label since Section 1.7.2 is being deleted this revision. Also, updated Table 5, note 1 to reflect deletion of Section 1.7.2. Section 1.4.1.3—Table 3: Updated the maximum input capacitance from 15 to 16 pF based on characterization data. Section 1.4.3.1—Updated PCI_SYNC_IN jitter specifications to 200 ps. Section 1.4.3.3—Table 11, item 12b: added the word 'address' to help clarify which signals the spec applies to. Figure 15: edited timing for items 12a0 and 12a2 to correspond with Table 11. Section 1.5.2—Changed some dimension values for the side view of package. Section 1.5.3—Updated notes for the $\overline{\text{QACK}}$/DA0 signal because this signal has been found to have no internal pull resistor. Section 1.6—Updated note numbering list for Table 19. Removed mode 5 from PLL tables since that mode is no longer supported. Section 1.7.2 —This section was removed as it was not necessary since the power information is covered in Section 1.4.1.5. Section 1.7.4—Added the words 'the clamping voltage' to describe LV_{DD} in the sixth paragraph. Changed the $\overline{\text{QACK}}$/DA0 signal from the list of signals having an internal pull-up resistor to the list of signals needing a weak pull-up resistor to OV_{DD}. Section 1.9.1—Table 21: Added processor version register value column.
3	—	Section 1.4.1.2—Changed recommended value in Table 2 for I/O buffer supply to 3.3 ± 0.3 V. Changed wording referencing Figure 4 to refer to the MPC8241. Section 1.4.2—Table 6: Updated values for thermal characterization data as per the new packaging and 266-MHz part. Added note 7 for the difference between the 166-/200-MHz and the 266-MHz packaging. Section 1.4.3—Corrected the voltage listing for the 266-MHz part to 1.8 ± 0.1 V in Table 7. Section 1.5—Changed package parameters and illustration based on new packaging. Section 1.6—Table 18: Modified PLL configuration for 166- and 200-MHz parts for mode 7 to specify that this mode is not available for Rev. D of the part. Added sentence to note 1 referencing update for mode 7. Table 19: Made several range updates for various modes to accommodate VCO limits. Added mode 7 and 1E updates for Rev. D. Updated VCO limits listed in notes 4, 6, and 7.
2	—	Section 1.4.1.2—Updated note 1 to include 266-MHz part. Added a line to cautions 2 and 3 in the notes section of Table 2. Added Figures 4 and 5 to show the overshoot and undershoot requirements for the PCI interface. Section 1.4.1.3—Table 3: Updated minimum value for input high voltage, and maximum value for capacitance. Section 1.4.3.2—Appended Figures 9 and 10. Section 1.4.3.4—Added a column to Table 13 to include 133-MHz memory bus speed for 266-MHz part. Section 1.5.2—Changed Figure 24 to accommodate new package offerings. Section 1.6—Added Table 19 for PLL of the 266-MHz part. Section 1.7.7—Corrected note numbering in COP connector diagram. Section 1.9.1—Updated package description in part marking nomenclature.
