
Welcome to E-XFL.COM

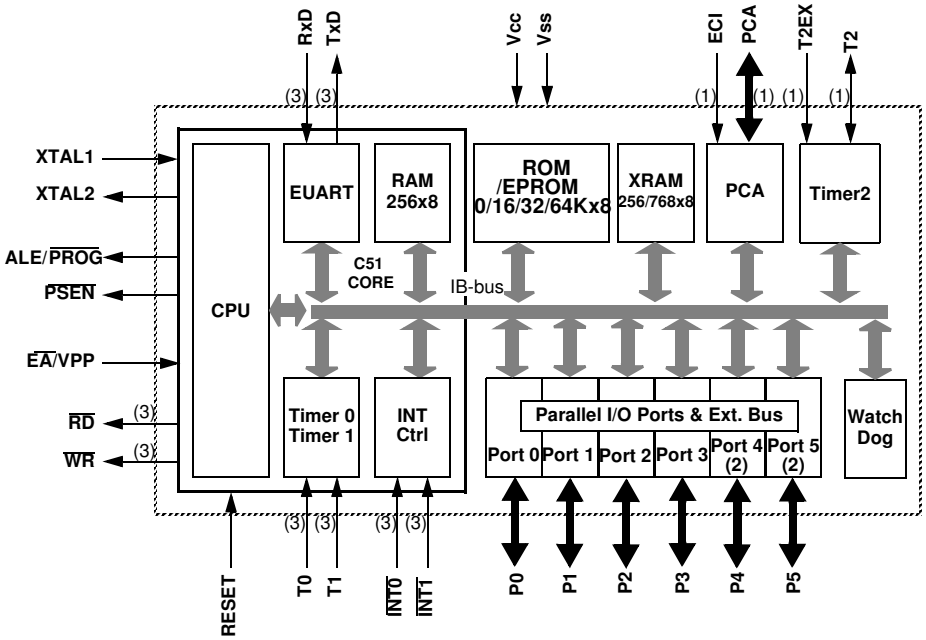
What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Obsolete
Core Processor	80C51
Core Size	8-Bit
Speed	40/20MHz
Connectivity	UART/USART
Peripherals	POR, PWM, WDT
Number of I/O	32
Program Memory Size	-
Program Memory Type	ROMless
EEPROM Size	-
RAM Size	256 x 8
Voltage - Supply (Vcc/Vdd)	4.5V ~ 5.5V
Data Converters	-
Oscillator Type	Internal
Operating Temperature	0°C ~ 70°C (TA)
Mounting Type	Surface Mount
Package / Case	44-QFP
Supplier Device Package	44-VQFP
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/ts80c51ra2-mce

3. Block Diagram



(1): Alternate function of Port 1

(2): Only available on high pin count packages

(3): Alternate function of Port 3

4. SFR Mapping

The Special Function Registers (SFRs) of the TS80C51Rx2 fall into the following categories:

- C51 core registers: ACC, B, DPH, DPL, PSW, SP, AUXR1
- I/O port registers: P0, P1, P2, P3, P4, P5
- Timer registers: T2CON, T2MOD, TCON, TH0, TH1, TH2, TMOD, TL0, TL1, TL2, RCAP2L, RCAP2H
- Serial I/O port registers: SADDR, SADEN, SBUF, SCON
- Power and clock control registers: PCON
- HDW Watchdog Timer Reset: WDTRST, WDTPRG
- PCA registers: CL, CH, CCAPiL, CCAPiH, CCON, CMOD, CCAPMi
- Interrupt system registers: IE, IP, IPH
- Others: AUXR, CKCON

Table 4-1. All SFRs with their address and their reset value

It is possible to use timer 2 as a baud rate generator and a clock generator simultaneously. For this configuration, the baud rates and clock frequencies are not independent since both functions use the values in the RCAP2H and RCAP2L registers.

Figure 6-3. Clock-Out Mode C/$\overline{T2}$ = 0

Figure 6-4. PCA Timer/Counter

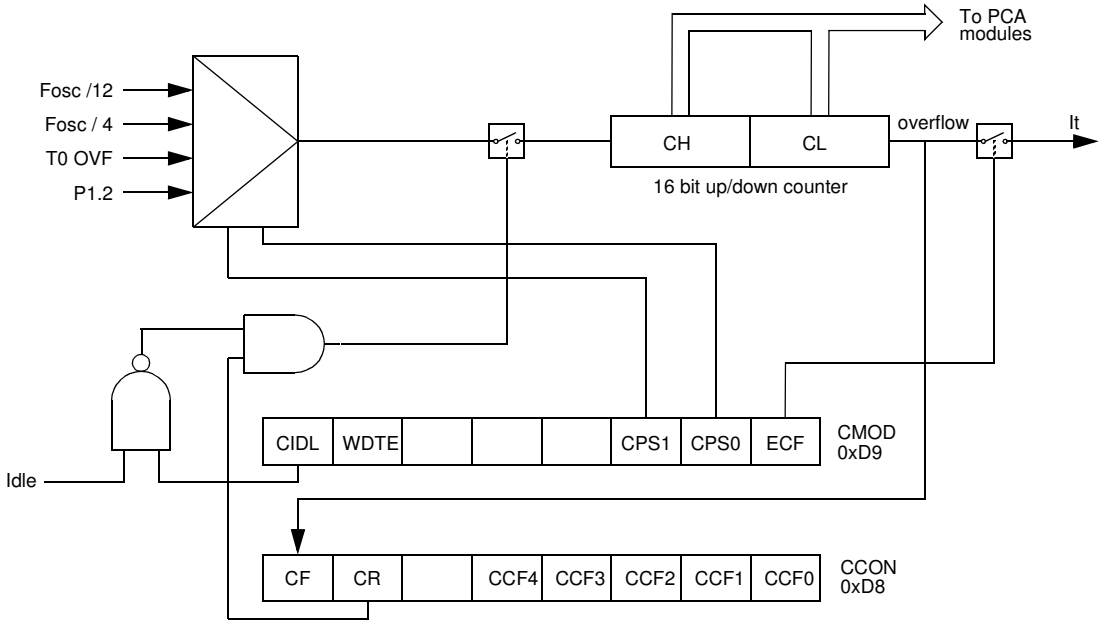

Table 6-4. CMOD: PCA Counter Mode Register

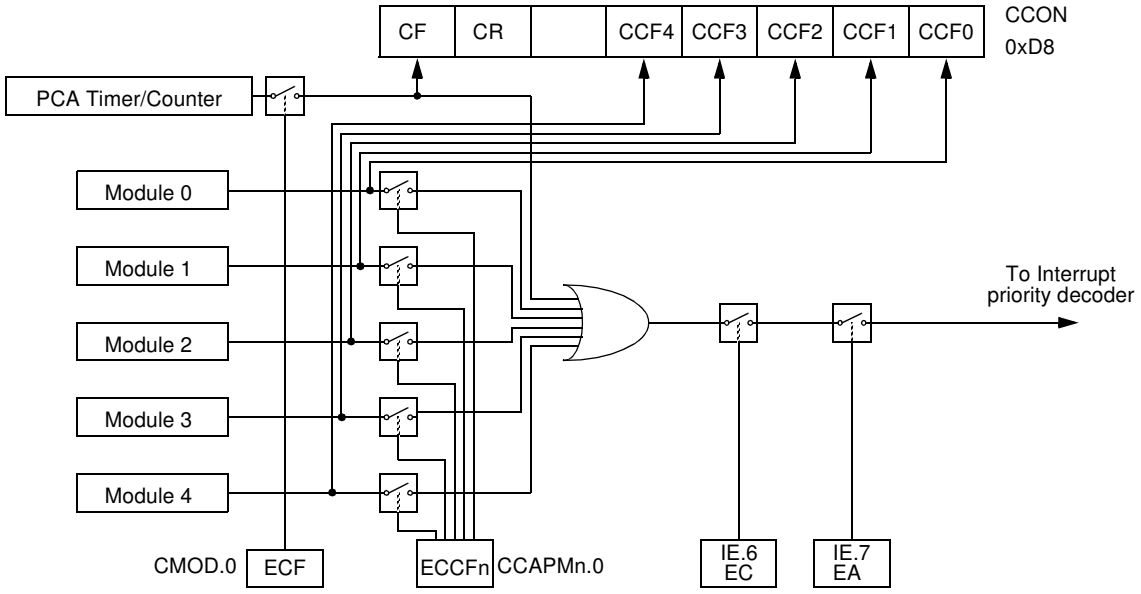
CMOD Address 0D9H	CIDL	WDTE	-	-	-	CPS1	CPS0	ECF
Reset value	0	0	X	X	X	0	0	0

Symbol	Function		
CIDL	Counter Idle control: CIDL = 0 programs the PCA Counter to continue functioning during idle Mode. CIDL = 1 programs it to be gated off during idle.		
WDTE	Watchdog Timer Enable: WDTE = 0 disables Watchdog Timer function on PCA Module 4. WDTE = 1 enables it.		
-	Not implemented, reserved for future use. (1)		
CPS1	PCA Count Pulse Select bit 1.		
CPS0	PCA Count Pulse Select bit 0.		
	CPS1	CPS0	Selected PCA input. (2)
	0	0	Internal clock f_{osc}/12 (Or f_{osc}/6 in X2 Mode).
	0	1	Internal clock f_{osc}/4 (Or f_{osc}/2 in X2 Mode).
	1	0	Timer 0 Overflow
	1	1	External clock at ECI/P1.2 pin (max rate = f_{osc}/ 8)
ECF	PCA Enable Counter Overflow interrupt: ECF = 1 enables CF bit in CCON to generate an interrupt. ECF = 0 disables that function of CF.		

1. User software should not write 1s to reserved bits. These bits may be used in future 8051 family products to invoke new features. In that case, the reset or inactive value of the new bit will be 0, and its active value will be 1. The value read from a reserved bit is indeterminate.
2. f_{osc} = oscillator frequency

The CMOD SFR includes three additional bits associated with the PCA (See Figure 6-4 and Table 6-4).

Figure 6-5. PCA Interrupt System



PCA Modules: each one of the five compare/capture modules has six possible functions. It can perform:

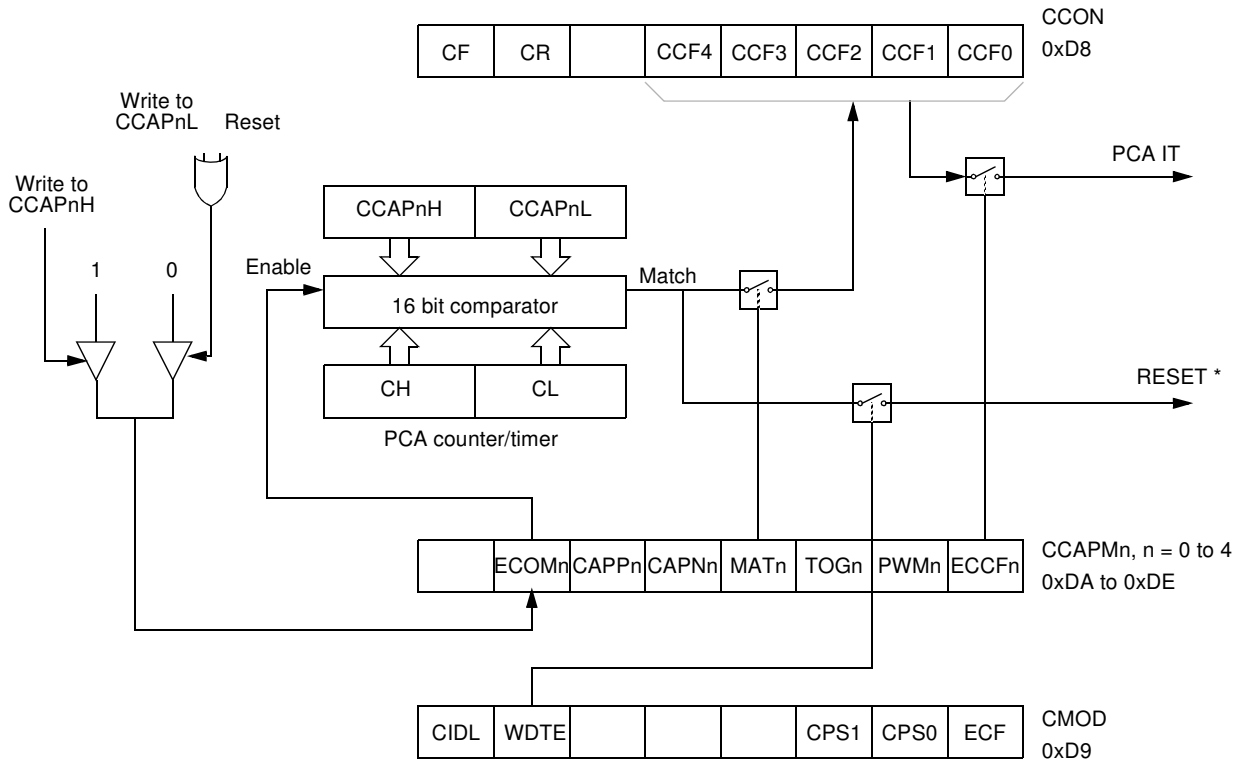
- 16-bit Capture, positive-edge triggered,
- 16-bit Capture, negative-edge triggered,
- 16-bit Capture, both positive and negative-edge triggered,
- 16-bit Software Timer,
- 16-bit High Speed Output,
- 8-bit Pulse Width Modulator.

In addition, module 4 can be used as a Watchdog Timer.

Each module in the PCA has a special function register associated with it. These registers are: CCAPM0 for module 0, CCAPM1 for module 1, etc. (See Table 6-6). The registers contain the bits that control the mode that each module will operate in.

- The ECCF bit (CCAPMn.0 where n=0, 1, 2, 3, or 4 depending on the module) enables the CCF flag in the CCON SFR to generate an interrupt when a match or compare occurs in the associated module.
- PWM (CCAPMn.1) enables the pulse width modulation mode.
- The TOG bit (CCAPMn.2) when set causes the CEX output associated with the module to toggle when there is a match between the PCA counter and the module's capture/compare register.
- The match bit MAT (CCAPMn.3) when set will cause the CCFn bit in the CCON register to be set when there is a match between the PCA counter and the module's capture/compare register.
- The next two bits CAPN (CCAPMn.4) and CAPP (CCAPMn.5) determine the edge that a capture input will be active on. The CAPN bit enables the negative edge, and the CAPP bit enables the positive edge. If both bits are set both edges will be enabled and a capture will occur for either transition.

Figure 6-7. PCA Compare Mode and PCA Watchdog Timer



* Only for Module 4

Before enabling ECOM bit, CCAPnL and CCAPnH should be set with a non zero value, otherwise an unwanted match could happen. Writing to CCAPnH will set the ECOM bit.

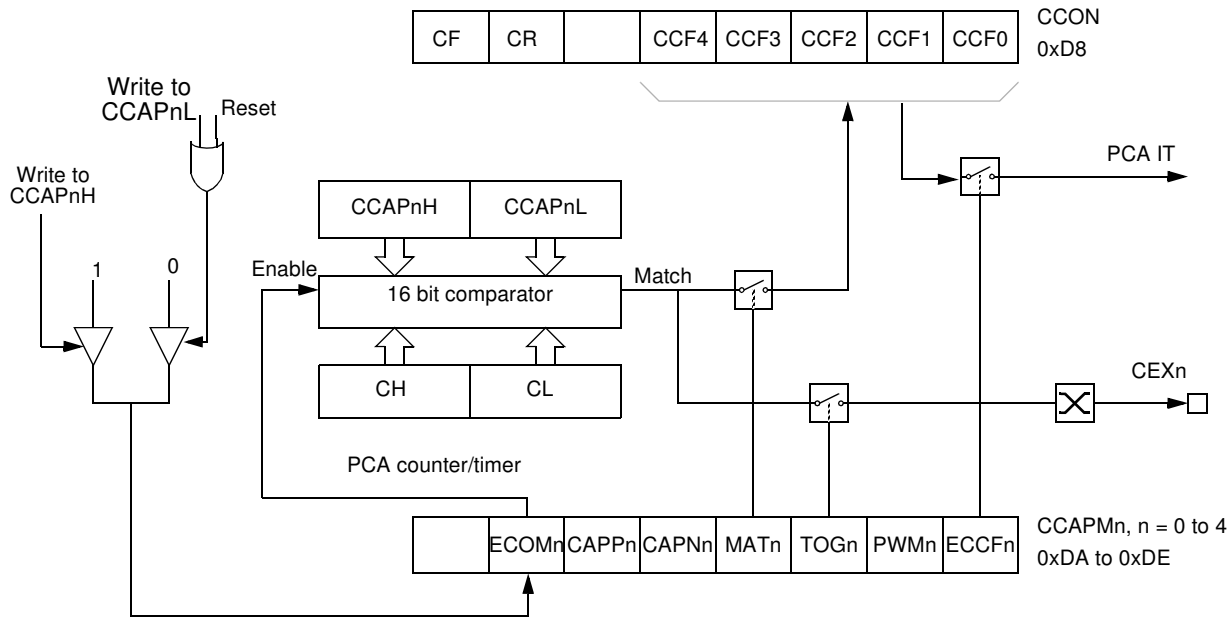
Once ECOM set, writing CCAPnL will clear ECOM so that an unwanted match doesn't occur while modifying the compare value. Writing to CCAPnH will set ECOM. For this reason, user software should write CCAPnL first, and then CCAPnH. Of course, the ECOM bit can still be controlled by accessing to CCAPMn register.

6.3.3 High Speed Output Mode

In this mode the CEX output (on port 1) associated with the PCA module will toggle each time a match occurs between the PCA counter and the module's capture registers. To activate this mode the TOG, MAT, and ECOM bits in the module's CCAPMn SFR must be set (See Figure 6-8).

A prior write must be done to CCAPnL and CCAPnH before writing the ECOMn bit.

Figure 6-8. PCA High Speed Output Mode



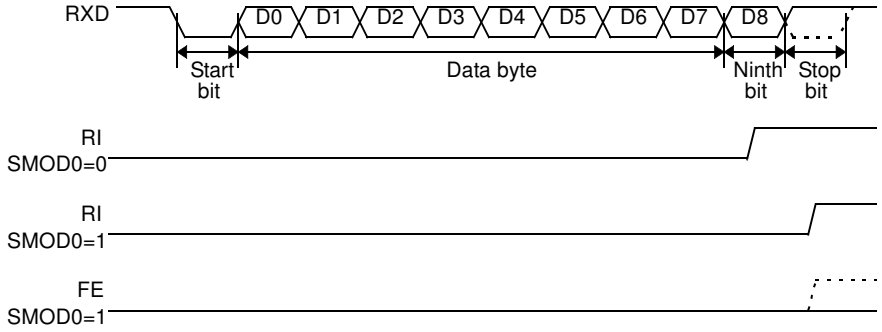
Before enabling ECOM bit, CCAPnL and CCAPnH should be set with a non zero value, otherwise an unwanted match could happen.

Once ECOM set, writing CCAPnL will clear ECOM so that an unwanted match doesn't occur while modifying the compare value. Writing to CCAPnH will set ECOM. For this reason, user software should write CCAPnL first, and then CCAPnH. Of course, the ECOM bit can still be controlled by accessing to CCAPMn register.

6.3.4 Pulse Width Modulator Mode

All of the PCA modules can be used as PWM outputs. Figure 6-9 shows the PWM function. The frequency of the output depends on the source for the PCA timer. All of the modules will have the same frequency of output because they all share the PCA timer. The duty cycle of each module is independently variable using the module's capture register CCAPLn. When the value of the PCA CL SFR is less than the value in the module's CCAPLn SFR the output will be low, when it is equal to or greater than the output will be high. When CL overflows from FF to 00, CCAPLn is reloaded with the value in CCAPHn. This allows updating the PWM without glitches. The PWM and ECOM bits in the module's CCAPMn register must be set to enable the PWM mode.

Figure 6-12. UART Timings in Modes 2 and 3



6.4.2 Automatic Address Recognition

The automatic address recognition feature is enabled when the multiprocessor communication feature is enabled (SM2 bit in SCON register is set).

Implemented in hardware, automatic address recognition enhances the multiprocessor communication feature by allowing the serial port to examine the address of each incoming command frame. Only when the serial port recognizes its own address, the receiver sets RI bit in SCON register to generate an interrupt. This ensures that the CPU is not interrupted by command frames addressed to other devices.
If desired, you may enable the automatic address recognition feature in mode 1. In this configuration, the stop bit takes the place of the ninth data bit. Bit RI is set only when the received command frame address matches the device's address and is terminated by a valid stop bit.

To support automatic address recognition, a device is identified by a given address and a broadcast address.

Note: The multiprocessor communication and automatic address recognition features cannot be enabled in mode 0 (i.e. setting SM2 bit in SCON register in mode 0 has no effect).

6.4.3 Given Address

Each device has an individual address that is specified in SADDR register; the SADEN register is a mask byte that contains don't-care bits (defined by zeros) to form the device's given address. The don't-care bits provide the flexibility to address one or more slaves at a time. The following example illustrates how a given address is formed.
To address a device by its individual address, the SADEN mask byte must be `1111 1111b`.

For example:

```
SADDR0101 0110b
SADEN1111 1100b
Given0101 01XXb
```

The following is an example of how to use given addresses to address different slaves:

```
Slave A:SADDR1111 0001b
   SADEN1111 1010b
   Given1111 0X0Xb

Slave B:SADDR1111 0011b
   SADEN1111 1001b
   Given1111 0XX1b
```

Table 6-18. IP Register

IP - Interrupt Priority Register (B8h)

7	6	5	4	3	2	1	0
-	PPC	PT2	PS	PT1	PX1	PT0	PX0

Bit Number	Bit Mnemonic	Description
7	-	**Reserved** The value read from this bit is indeterminate. Do not set this bit.
6	PPC	**PCA interrupt priority bit** Refer to PPCH for priority level.
5	PT2	**Timer 2 overflow interrupt Priority bit** Refer to PT2H for priority level.
4	PS	**Serial port Priority bit** Refer to PSH for priority level.
3	PT1	**Timer 1 overflow interrupt Priority bit** Refer to PT1H for priority level.
2	PX1	**External interrupt 1 Priority bit** Refer to PX1H for priority level.
1	PT0	**Timer 0 overflow interrupt Priority bit** Refer to PT0H for priority level.
0	PX0	**External interrupt 0 Priority bit** Refer to PX0H for priority level.

Reset Value = X000 0000b

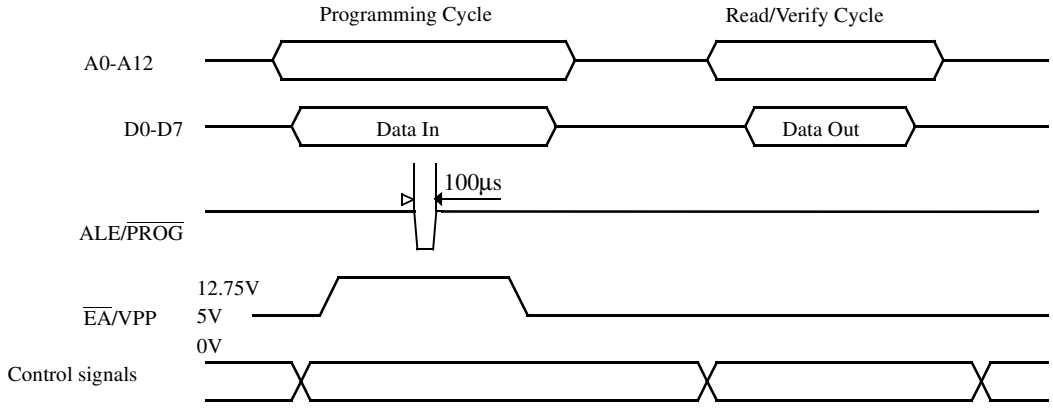
8.2.4 Verify Algorithm

Refer to Section “Verify algorithm”.

The encryption array cannot be directly verified. Verification of the encryption array is done by observing that the code array is well encrypted.

Figure 9-2. Programming and Verification Signal's Waveform



9.4 EPROM Erasure (Windowed Packages Only)

Erasing the EPROM erases the code array, the encryption array and the lock bits returning the parts to full functionality.

Erasure leaves all the EPROM cells in a 1's state (FF).

9.4.1 Erasure Characteristics

The recommended erasure procedure is exposure to ultraviolet light (at 2537 Å) to an integrated dose at least 15 W-sec/cm^2. Exposing the EPROM to an ultraviolet lamp of 12,000 µW/cm^2 rating for 30 minutes, at a distance of about 25 mm, should be sufficient. An exposure of 1 hour is recommended with most of standard erasers.

Erasure of the EPROM begins to occur when the chip is exposed to light with wavelength shorter than approximately 4,000 Å. Since sunlight and fluorescent lighting have wavelengths in this range, exposure to these light sources over an extended time (about 1 week in sunlight, or 3 years in room-level fluorescent lighting) could cause inadvertent erasure. If an application subjects the device to this type of exposure, it is suggested that an opaque label be placed over the window.

10. Signature Bytes

The TS83/87C51RB2/RC2/RD2 has four signature bytes in location 30h, 31h, 60h and 61h. To read these bytes follow the procedure for EPROM verify but activate the control lines provided in Table 31. for Read Signature Bytes. Table 10-1. shows the content of the signature byte for the TS87C51RB2/RC2/RD2.

Table 10-1. Signature Bytes Content

Location	Contents	Comment
30h	58h	Manufacturer Code: Atmel
31h	57h	Family Code: C51 X2
60h	7Ch	Product name: TS83C51RD2

Table 11-1. DC Parameters in Standard Voltage

Symbol	Parameter	Min	Typ	Max	Unit	Test Conditions
V_{OH}	Output High Voltage, ports 1, 2, 3, 4, 5	V_{CC} - 0.3 V_{CC} - 0.7 V_{CC} - 1.5			V V V	I_{OH} = -10 µA I_{OH} = -30 µA I_{OH} = -60 µA V_{CC} = 5 V ± 10%
V_{OH1}	Output High Voltage, port 0	V_{CC} - 0.3 V_{CC} - 0.7 V_{CC} - 1.5			V V V	I_{OH} = -200 µA I_{OH} = -3.2 mA I_{OH} = -7.0 mA V_{CC} = 5 V ± 10%
V_{OH2}	Output High Voltage,ALE, $\overline{PSEN}$	V_{CC} - 0.3 V_{CC} - 0.7 V_{CC} - 1.5			V V V	I_{OH} = -100 µA I_{OH} = -1.6 mA I_{OH} = -3.5 mA V_{CC} = 5 V ± 10%
R_{RST}	RST Pulldown Resistor	50	90 (5)	200	kΩ	
I_{IL}	Logical 0 Input Current ports 1, 2, 3, 4, 5			-50	µA	Vin = 0.45 V
I_{LI}	Input Leakage Current			±10	µA	0.45 V < Vin < V_{CC}
I_{TL}	Logical 1 to 0 Transition Current, ports 1, 2, 3, 4, 5			-650	µA	Vin = 2.0 V
C_{IO}	Capacitance of I/O Buffer			10	pF	Fc = 1 MHz T_A = 25°C
I_{PD}	Power-down Current		20(5)	50	µA	2.0 V < V_{CC} < 5.5 V(3)
I_{CC} under RESET	Power Supply Current Maximum values, X1 mode: (7)			1 + 0.4 Freq (MHz) @12MHz 5.8 @16MHz 7.4	mA	V_{CC} = 5.5 V(1)
I_{CC} operating	Power Supply Current Maximum values, X1 mode: (7)			3 + 0.6 Freq (MHz) @12MHz 10.2 @16MHz 12.6	mA	V_{CC} = 5.5 V(8)
I_{CC} idle	Power Supply Current Maximum values, X1 mode: (7)			0.25+0.3 Freq (MHz) @12MHz 3.9 @16MHz 5.1	mA	V_{CC} = 5.5 V(2)

T_A = 0 to +70°C (commercial temperature range); V_{SS} = 0 V; 2.7 V < V_{CC} < 5.5 V; -L range.
T_A = -40°C to +85°C (industrial temperature range); V_{SS} = 0 V; 2.7 V < V_{CC} < 5.5 V; -L range.

Table 11-3. gives the maximum applicable load capacitance for Port 0, Port 1, 2 and 3, and ALE and $\overline{PSEN}$ signals. Timings will be guaranteed if these capacitances are respected. Higher capacitance values can be used, but timings will then be degraded.

Table 11-3. Load Capacitance versus speed range, in pF

	-M	-V	-L
Port 0	100	50	100
Port 1, 2, 3	80	50	80
ALE / $\overline{PSEN}$	100	30	100

Table 11-5., Table 39. and Table 42. give the description of each AC symbols.

Table 11-6., Table 11-8. and Table 11-10. give for each range the AC parameter.

Table 11-7., Table 11-9. and Table 11-11. give the frequency derating formula of the AC parameter. To calculate each AC symbols, take the x value corresponding to the speed grade you need (-M, -V or -L) and replace this value in the formula. Values of the frequency must be limited to the corresponding speed grade:

Table 11-4. Max frequency for derating formula regarding the speed grade

	-M X1 mode	-M X2 mode	-V X1 mode	-V X2 mode	-L X1 mode	-L X2 mode
Freq (MHz)	40	20	40	30	30	20
T (ns)	25	50	25	33.3	33.3	50

Example:

T_{LLIV} in X2 mode for a -V part at 20 MHz (T = $1/20^{E6}$ = 50 ns):

x= 22 (Table 11-7.)

T= 50ns

T_{LLIV}= 2T - x = 2 x 50 - 22 = 78ns
