What is "[Embedded - Microcontrollers](#)"?

"[Embedded - Microcontrollers](#)" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

■ Static Electricity

Because semiconductor devices are particularly susceptible to damage by static electricity, you must take the following precautions:

- (1) Maintain relative humidity in the working environment between 40% and 70%. Use of an apparatus for ion generation may be needed to remove electricity.
- (2) Electrically ground all conveyors, solder vessels, soldering irons and peripheral equipment.
- (3) Eliminate static body electricity by the use of rings or bracelets connected to ground through high resistance (on the level of 1 MΩ).
Wearing of conductive clothing and shoes, use of conductive floor mats and other measures to minimize shock loads is recommended.
- (4) Ground all fixtures and instruments, or protect with anti-static measures.
- (5) Avoid the use of styrofoam or other highly static-prone materials for storage of completed board assemblies.

12.3 Precautions for Use Environment

Reliability of semiconductor devices depends on ambient temperature and other conditions as described above.

For reliable performance, do the following:

- (1) Humidity
Prolonged use in high humidity can lead to leakage in devices as well as printed circuit boards. If high humidity levels are anticipated, consider anti-humidity processing.
- (2) Discharge of Static Electricity
When high-voltage charges exist close to semiconductor devices, discharges can cause abnormal operation. In such cases, use anti-static measures or processing to prevent discharges.
- (3) Corrosive Gases, Dust, or Oil
Exposure to corrosive gases or contact with dust or oil may lead to chemical reactions that will adversely affect the device. If you use devices in such conditions, consider ways to prevent such exposure or to protect the devices.
- (4) Radiation, Including Cosmic Radiation
Most devices are not designed for environments involving exposure to radiation or cosmic radiation. Users should provide shielding as appropriate.
- (5) Smoke, Flame
CAUTION: Plastic molded devices are flammable, and therefore should not be used near combustible substances. If devices begin to smoke or burn, there is danger of the release of toxic gases.

Customers considering the use of Cypress products in other special environmental conditions should consult with sales representatives.

(2) Single Phase External Clock for Sub Oscillator

When using a single phase external clock for the Sub oscillator, “External clock mode” must be selected and X0A/P04_0 pin must be driven. X1A/P04_1 pin can be configured as GPIO.

(3) Opposite Phase External Clock

When using an opposite phase external clock, X1 (X1A) pins must be supplied with a clock signal which has the opposite phase to the X0 (X0A) pins. Supply level on X0 and X1 pins must be 1.8V.

4. Notes on PLL Clock Mode Operation

If the microcontroller is operated with PLL clock mode and no external oscillator is operating or no external clock is supplied, the microcontroller attempts to work with the free oscillating PLL. Performance of this operation, however, cannot be guaranteed.

5. Power Supply Pins (V_{CC}/V_{SS})

It is required that all V_{CC}-level as well as all V_{SS}-level power supply pins are at the same potential. If there is more than one V_{CC} or V_{SS} level, the device may operate incorrectly or be damaged even within the guaranteed operating range.

V_{CC} and V_{SS} pins must be connected to the device from the power supply with lowest possible impedance.

The smoothing capacitor at V_{CC} pin must use the one of a capacity value that is larger than C_s.

Besides this, as a measure against power supply noise, it is required to connect a bypass capacitor of about 0.1 μF between V_{CC} and V_{SS} pins as close as possible to V_{CC} and V_{SS} pins.

6. Crystal Oscillator and ceramic resonator Circuit

Noise at X0, X1 pins or X0A, X1A pins might cause abnormal operation. It is required to provide bypass capacitors with shortest possible distance to X0, X1 pins and X0A, X1A pins, crystal oscillator (or ceramic resonator) and ground lines, and, to the utmost effort, that the lines of oscillation circuit do not cross the lines of other circuits.

It is highly recommended to provide a printed circuit board art work surrounding X0, X1 pins and X0A, X1A pins with a ground area for stabilizing the operation.

It is highly recommended to evaluate the quartz/MCU or resonator/MCU system at the quartz or resonator manufacturer, especially when using low-Q resonators at higher frequencies.

7. Turn on Sequence of Power Supply to A/D Converter and Analog Inputs

It is required to turn the A/D converter power supply (AV_{CC}, AVR_H, AVR_L) and analog inputs (AN_n) on after turning the digital power supply (V_{CC}) on.

It is also required to turn the digital power off after turning the A/D converter supply and analog inputs off. In this case, AVR_H must not exceed AV_{CC}. Input voltage for ports shared with analog input ports also must not exceed AV_{CC} (turning the analog and digital power supplies simultaneously on or off is acceptable).

8. Pin Handling when not using the A/D Converter

If the A/D converter is not used, the power supply pins for A/D converter should be connected such as AV_{CC} = V_{CC}, AV_{SS} = AVR_H = AVR_L = V_{SS}.

14.2 Recommended Operating Conditions

($V_{SS} = AV_{SS} = DV_{SS} = 0V$)

Parameter	Symbol	Value			Unit	Remarks
		Min	Typ	Max		
Power supply voltage	V_{CC}, AV_{CC}, DV_{CC}	2.7	-	5.5	V	
		2.0	-	5.5	V	Maintains RAM data in stop mode
Smoothing capacitor at C pin	C_S	0.5	1.0 to 3.9	4.7	μF	1.0 μF (Allowance within $\pm 50\%$) 3.9 μF (Allowance within $\pm 20\%$) Please use the ceramic capacitor or the capacitor of the frequency response of this level. The smoothing capacitor at V_{CC} must use the one of a capacity value that is larger than C_S .

WARNING

The recommended operating conditions are required in order to ensure the normal operation of the semiconductor device. All of the device's electrical characteristics are warranted when the device is operated within these ranges.

Always use semiconductor devices within their recommended operating condition ranges. Operation outside these ranges may adversely affect reliability and could result in device failure. No warranty is made with respect to uses, operating conditions, or combinations not represented on the data sheet. Users considering application outside the listed conditions are advised to contact their representatives beforehand.

14.5.3 Definition of A/D Converter Terms

- Resolution : Analog variation that is recognized by an A/D converter.
- Nonlinearity error : Deviation of the actual conversion characteristics from a straight line that connects the zero transition point (0b0000000000 ↔ 0b0000000001) to the full-scale transition point (0b1111111110 ↔ 0b1111111111).
- Differential nonlinearity error : Deviation from the ideal value of the input voltage that is required to change the output code by 1LSB.
- Total error : Difference between the actual value and the theoretical value. The total error includes zero transition error, full-scale transition error and nonlinearity error.
- Zero transition voltage: Input voltage which results in the minimum conversion value.
- Full scale transition voltage: Input voltage which results in the maximum conversion value.

$$\text{Nonlinearity error of digital output } N = \frac{V_{NT} - \{1\text{LSB} \times (N - 1) + V_{OT}\}}{1\text{LSB}} \text{ [LSB]}$$

$$\text{Differential nonlinearity error of digital output } N = \frac{V_{(N+1)T} - V_{NT}}{1\text{LSB}} - 1 \text{ [LSB]}$$

$$1\text{LSB} = \frac{V_{FST} - V_{OT}}{1022}$$

- N : A/D converter digital output value.
- V_{OT} : Voltage at which the digital output changes from 0x000 to 0x001.

*1: If the power supply voltage fluctuates within the time less than the detection delay time (t_d), there is a possibility that the low voltage detection will occur or stop after the power supply voltage passes the detection range.

*2: In order to perform the low voltage detection at the detection voltage (V_{DLX}), be sure to suppress fluctuation of the power supply voltage within the limits of the change ration of power supply voltage.

23	User ROM Memory Map For Flash Devices	Changed the annotation Others (from DF:0200_H to DF:1FFF_H) are all mirror area of SAS-512B. → Others (from DF:0200_H to DF:1FFF_H) is mirror area of SAS-512B.
25	Interrupt Vector Table	Changed the Description of CALLV0 to CALLV7 Reserved → CALLV instruction Changed the Description of RESET Reserved → Reset vector Changed the Description of INT9 Reserved → INT9 instruction Changed the Description of EXCEPTION Reserved → Undefined instruction execution
26		Changed the Vector name of Vector number 64 PPGRLT → RLT6 Changed the Description of Vector number 64 Reload Timer 6 can be used as PPG clock source → Reload Timer 6
29 to 32	Handling Precautions	Added a section
34	Handling Devices	Added the description to "3. External clock usage" (3) Opposite phase external clock Changed the description in "7. Turn on sequence of power supply to A/D converter and analog inputs" In this case, the voltage must not exceed AVR_H or AV_{CC} → In this case, AVR_H must not exceed AV_{CC}. Input voltage for ports shared with analog input ports also must not exceed AV_{CC}
35	Handling Devices	Changed the description in "11. SMC power supply pins" To avoid this, V_{CC} must always be powered on before DV_{CC}. → To avoid this, V_{CC} must always be powered on before DV_{CC}. DV_{CC}/DV_{SS} must be applied when using SMC I/O pin as GPIO. Added the description "13. Mode Pin (MD)"
36	Electrical Characteristics Absolute Maximum Ratings	Changed the Symbol of "L" level average overall output current" $\Sigma I_{OLSMCAV}$ → $\Sigma I_{OLAVSMC}$ Changed the Symbol of "H" level average overall output current" $\Sigma I_{OHSMCAV}$ → $\Sigma I_{OHAVSMC}$
37		Changed the annotation *2 It is required that AV_{CC} does not exceed V_{CC} and that the voltage at the analog inputs does not exceed AV_{CC} when the power is switched on. → It is required that AV_{CC} does not exceed V_{CC}, DV_{CC} and that the voltage at the analog inputs does not exceed AV_{CC} when the power is switched on. Changed the annotation *3 Input/Output voltages of standard ports depend on V_{CC}. → Input/Output voltages of high current ports depend on DV_{CC}. Input/Output voltages of standard ports depend on V_{CC}.
