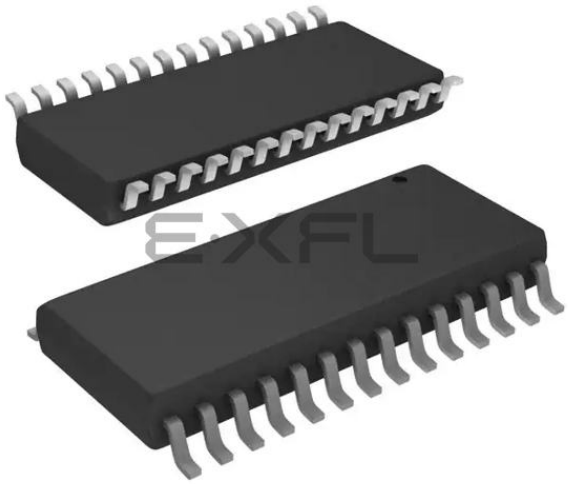
Microchip Technology - DSPIC33FJ06GS102-E/SO Datasheet



Welcome to E-XFL.COM

What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

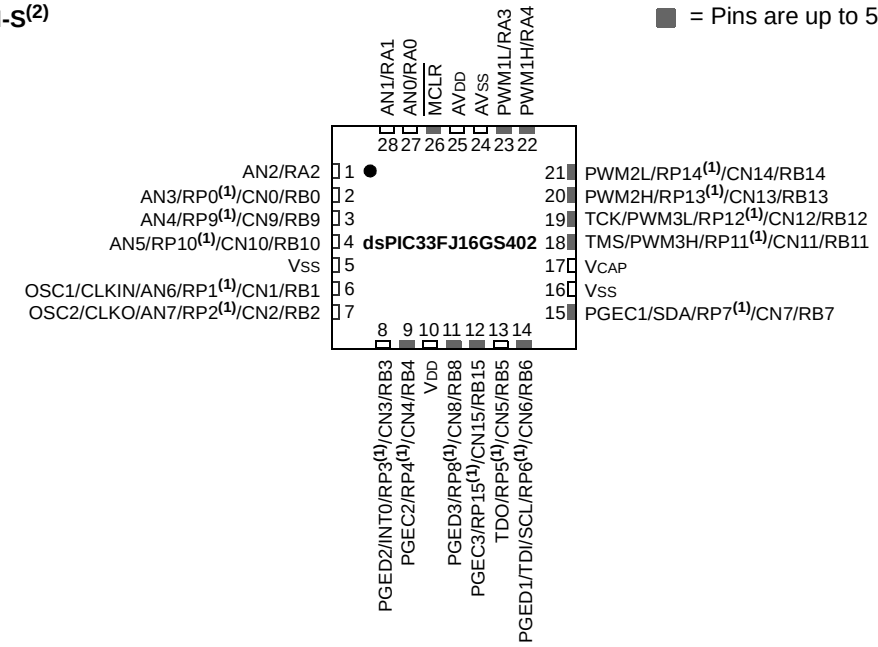
Applications of "Embedded - Microcontrollers"

Details	
Product Status	Active
Core Processor	dsPIC
Core Size	16-Bit
Speed	40 MIPs
Connectivity	I²C, IrDA, LINbus, SPI, UART/USART
Peripherals	Brown-out Detect/Reset, POR, PWM, WDT
Number of I/O	21
Program Memory Size	6KB (6K x 8)
Program Memory Type	FLASH
EEPROM Size	-
RAM Size	256 x 8
Voltage - Supply (Vcc/Vdd)	3V ~ 3.6V
Data Converters	A/D 6x10b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 125°C (TA)
Mounting Type	Surface Mount
Package / Case	28-SOIC (0.295", 7.50mm Width)
Supplier Device Package	28-SOIC
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/dspic33fj06gs102-e-so

Pin Diagrams (Continued)

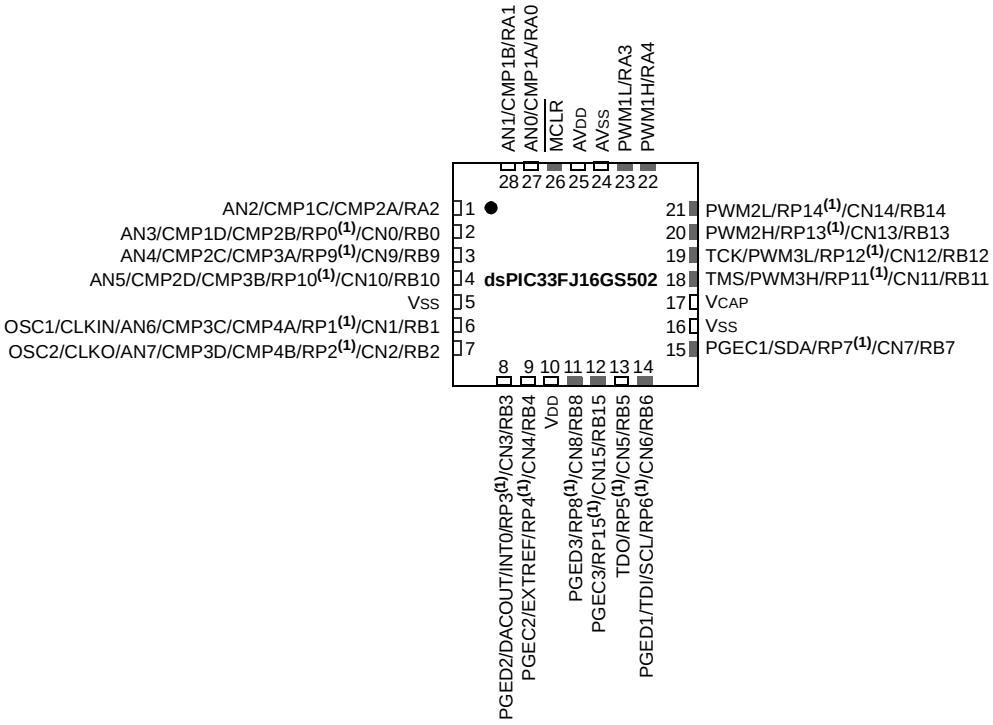
28-Pin QFN-S(2)

■ = Pins are up to 5V tolerant



28-Pin QFN-S, UQFN(2,3)

■ = Pins are up to 5V tolerant



Note 1: The RPn pins can be used by any remappable peripheral. See **Table 1** for the list of available peripherals.

2: The metal plane at the bottom of the device is not connected to any pins and is recommended to be connected to VSS externally.

3: This package is available only in Extended temperature and not Industrial temperature (applies to dsPIC33FJ16GS502 UQFN package only).

Table of Contents

TABLE 1-1: PINOUT I/O DESCRIPTIONS

Pin Name	Pin Type	Buffer Type	PPS Capable	Description
AN0-AN11	I	Analog	No	Analog input channels
CLKI	I	ST/CMOS	No	External clock source input. Always associated with OSC1 pin function.
CLKO	O	—	No	Oscillator crystal output. Connects to crystal or resonator in Crystal Oscillator mode. Optionally functions as CLKO in RC and EC modes. Always associated with OSC2 pin function.
OSC1	I	ST/CMOS	No	Oscillator crystal input. ST buffer when configured in RC mode; CMOS otherwise.
OSC2	I/O	—	No	Oscillator crystal output. Connects to crystal or resonator in Crystal Oscillator mode. Optionally functions as CLKO in RC and EC modes.
CN0-CN29	I	ST	No	Change Notification inputs. Can be software programmed for internal weak pull-ups on all inputs.
IC1-IC2	I	ST	Yes	Capture Inputs 1/2.
OCFA	I	ST	Yes	Compare Fault A input (for Compare Channels 1 and 2)
OC1-OC2	O	—	Yes	Compare Outputs 1 through 2.
INT0	I	ST	No	External Interrupt 0.
INT1	I	ST	Yes	External Interrupt 1.
INT2	I	ST	Yes	External Interrupt 2.
RA0-RA4	I/O	ST	No	PORTA is a bidirectional I/O port.
RB0-RB15	I/O	ST	No	PORTB is a bidirectional I/O port.
RC0-RC13	I/O	ST	No	PORTC is a bidirectional I/O port.
RP0-RP29	I/O	ST	No	Remappable I/O pins.
T1CK	I	ST	Yes	Timer1 external clock input.
T2CK	I	ST	Yes	Timer2 external clock input.
T3CK	I	ST	Yes	Timer3 external clock input.
$\overline{\text{U1CTS}}$	I	ST	Yes	UART1 Clear-To-Send.
U1RTS	O	—	Yes	UART1 Ready-To-Send.
U1RX	I	ST	Yes	UART1 receive.
U1TX	O	—	Yes	UART1 transmit.
SCK1	I/O	ST	Yes	Synchronous serial clock input/output for SPI1.
SDI1	I	ST	Yes	SPI1 data in.
SDO1	O	—	Yes	SPI1 data out.
$\overline{\text{SS1}}$	I/O	ST	Yes	SPI1 slave synchronization or frame pulse I/O.
SCL1	I/O	ST	No	Synchronous serial clock input/output for I2C1.
SDA1	I/O	ST	No	Synchronous serial data input/output for I2C1.
TMS	I	TTL	No	JTAG Test mode select pin.
TCK	I	TTL	No	JTAG test clock input pin.
TDI	I	TTL	No	JTAG test data input pin.
TDO	O	—	No	JTAG test data output pin.

Legend: CMOS = CMOS compatible input or output; Analog = Analog input; I = Input
ST = Schmitt Trigger input with CMOS levels; P = Power; O = Output
TTL = Transistor-Transistor Logic; PPS = Peripheral Pin Select

3.0 CPU

Note 1: This data sheet summarizes the features of the dsPIC33FJ06GS101/X02 and dsPIC33FJ16GSX02/X04 families of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **"CPU"** (DS70204) in the "*dsPIC33F/PIC24H Family Reference Manual*", which is available from the Microchip web site (www.microchip.com).

2: Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 "Memory Organization"** in this data sheet for device-specific register and bit information.

The CPU module has a 16-bit (data) modified Harvard architecture with an enhanced instruction set, including significant support for DSP. The CPU has a 24-bit instruction word with a variable length opcode field. The Program Counter (PC) is 23 bits wide and addresses up to 4M x 24 bits of user program memory space. The actual amount of program memory implemented varies from device to device. A single-cycle instruction prefetch mechanism is used to help maintain throughput and provides predictable execution. All instructions execute in a single cycle, with the exception of instructions that change the program flow, the double-word move (`MOV.D`) instruction and the table instructions. Overhead-free program loop constructs are supported using the `DO` and `REPEAT` instructions, both of which are interruptible at any point.

dsPIC33FJ06GS101/X02 and dsPIC33FJ16GSX02/X04 devices have sixteen, 16-bit Working registers in the programmer's model. Each of the Working registers can serve as a data, address or address offset register. The sixteenth Working register (W15) operates as a software Stack Pointer (SP) for interrupts and calls.

There are two classes of instruction in the dsPIC33FJ06GS101/X02 and dsPIC33FJ16GSX02/X04 devices: MCU and DSP. These two instruction classes are seamlessly integrated into a single CPU. The instruction set includes many addressing modes and is designed for optimum C compiler efficiency. For most instructions, the dsPIC33FJ06GS101/X02 and dsPIC33FJ16GSX02/X04 is capable of executing a data (or program data) memory read, a Working register (data) read, a data memory write and a program (instruction) memory read per instruction cycle. As a result, three parameter instructions can be supported, allowing A + B = C operations to be executed in a single cycle.

A block diagram of the CPU is shown in Figure 3-1, and the programmer's model is shown in Figure 3-2.

3.1 Data Addressing Overview

The data space can be addressed as 32K words or 64 Kbytes and is split into two blocks, referred to as X and Y data memory. Each memory block has its own independent Address Generation Unit (AGU). The MCU class of instructions operates solely through the X memory AGU, which accesses the entire memory map as one linear data space. Certain DSP instructions operate through the X and Y AGUs to support dual operand reads, which splits the data address space into two parts. The X and Y data space boundary is device-specific.

Overhead-free circular buffers (Modulo Addressing mode) are supported in both X and Y address spaces. The Modulo Addressing removes the software boundary checking overhead for DSP algorithms. Furthermore, the X AGU circular addressing can be used with any of the MCU class of instructions. The X AGU also supports Bit-Reversed Addressing to greatly simplify input or output data reordering for radix-2 FFT algorithms.

The upper 32 Kbytes of the data space memory map can optionally be mapped into program space at any 16K program word boundary defined by the 8-bit Program Space Visibility Page (PSVPAG) register. The program-to-data space mapping feature allows any instruction access program space as if it were data space.

3.2 DSP Engine Overview

The DSP engine features a high-speed, 17-bit by 17-bit multiplier, a 40-bit ALU, two 40-bit saturating accumulators and a 40-bit bidirectional barrel shifter. The barrel shifter is capable of shifting a 40-bit value up to 16 bits, right or left, in a single cycle. The DSP instructions operate seamlessly with all other instructions and have been designed for optimal real-time performance. The `MAC` instruction and other associated instructions can concurrently fetch two data operands from memory while multiplying two W registers and accumulating and optionally saturating the result in the same cycle. This instruction functionality requires that the RAM data space be split for these instructions and linear for all others. Data space partitioning is achieved in a transparent and flexible manner through dedicating certain Working registers to each address space.

8.1.3 PLL CONFIGURATION

The primary oscillator and internal FRC oscillator can optionally use an on-chip PLL to obtain higher speeds of operation. The PLL provides significant flexibility in selecting the device operating speed. A block diagram of the PLL is shown in Figure 8-2.

The output of the primary oscillator or FRC, denoted as 'FIN', is divided down by a prescale factor (N1) of 2, 3, ... or 33 before being provided to the PLL's Voltage Controlled Oscillator (VCO). The input to the VCO must be selected in the range of 0.8 MHz to 8 MHz. The prescale factor 'N1' is selected using the PLLPRE<4:0> bits (CLKDIV<4:0>).

The PLL Feedback Divisor, selected using the PLLDIV<8:0> bits (PLLFBD<8:0>), provides a factor, 'M', by which the input to the VCO is multiplied. This factor must be selected such that the resulting VCO output frequency is in the range of 100 MHz to 200 MHz.

The VCO output is further divided by a postscale factor, 'N2'. This factor is selected using the PLLPOST<1:0> bits (CLKDIV<7:6>). 'N2' can be either 2, 4, or 8, and must be selected such that the PLL output frequency (FOSC) is in the range of 12.5 MHz to 80 MHz, which generates device operating speeds of 6.25-40 MIPS.

For a primary oscillator or FRC oscillator, output 'FIN', the PLL output 'FOSC' is given by Equation 8-2.

EQUATION 8-2: FOSC CALCULATION

$$FOSC = FIN * \left(\frac{M}{N1*N2}\right)$$

For example, suppose a 10 MHz crystal is being used with the selected oscillator mode of XT with PLL (see Equation 8-3).

- If PLLPRE<4:0> = 0, then N1 = 2. This yields a VCO input of 10/2 = 5 MHz, which is within the acceptable range of 0.8-8 MHz.
- If PLLDIV<8:0> = 0x1E, then M = 32. This yields a VCO output of 5 x 32 = 160 MHz, which is within the 100-200 MHz ranged needed.
- If PLLPOST<1:0> = 0, then N2 = 2. This provides a Fosc of 160/2 = 80 MHz. The resultant device operating speed is 80/2 = 40 MIPS.

EQUATION 8-3: XT WITH PLL MODE EXAMPLE

$$FCY = \frac{FOSC}{2} = \frac{1}{2}\left(\frac{10000000 * 32}{2 * 2}\right) = 40 \text{ MIPS}$$

bit 15-8 **Unimplemented:** Read as '0'

bit 7 **IRQEN6:** Interrupt Request Enable 6 bit
1 = Enables IRQ generation when requested conversion of Channels AN13 and AN12 is completed
0 = IRQ is not generated

bit 6 **PEND6:** Pending Conversion Status 6 bit
1 = Conversion of Channels AN13 and AN 12 is pending; set when selected trigger is asserted
0 = Conversion is complete

bit 5 **SWTRG6:** Software Trigger 6 bit
1 = Starts conversion of AN13 (INTREF) and AN12 (EXTREF) (if selected by the TRGSRCx bits)(2)
This bit is automatically cleared by hardware when the PEND6 bit is set.
0 = Conversion has not started

Note 1: This register is only implemented on the dsPIC33FJ16GS502 and dsPIC33FJ16GS504 devices.

2: The trigger source must be set as global software trigger prior to setting this bit to '1'. If other conversions are in progress, conversion will be performed when the conversion resources are available.

REGISTER 20-1: CMPCONx: COMPARATOR CONTROL x REGISTER

R/W-0	U-0	R/W-0	r-0	r-0	r-0	r-0	R/W-0
CMPON	—	CMPSIDL	r	r	r	r	DACOE
bit 15							bit 8

R/W-0	R/W-0	R/W-0	r-0	R/W-0	r-0	R/W-0	R/W-0
INSEL1	INSEL0	EXTREF	r	CMPSTAT	r	CMPPOL	RANGE
bit 7							bit 0

Legend:	r = Reserved bit		
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 15 **CMPON:** Comparator Operating Mode bit
1 = Comparator module is enabled
0 = Comparator module is disabled (reduces power consumption)

bit 14 **Unimplemented:** Read as '0'

bit 13 **CMPSIDL:** Comparator Stop in Idle Mode bit
1 = Discontinues module operation when device enters Idle mode.
0 = Continues module operation in Idle mode
If a device has multiple comparators, any CMPSIDL bit set to '1' disables **ALL** comparators while in Idle mode.

bit 12-9 **Reserved:** Read as '0'

bit 8 **DACOE:** DAC Output Enable
1 = DAC analog voltage is output to the DACOUT pin**(1)**
0 = DAC analog voltage is not connected to the DACOUT pin

bit 7-6 **INSEL<1:0>:** Input Source Select for Comparator bits
00 = Selects CMPxA input pin
01 = Selects CMPxB input pin
10 = Selects CMPxC input pin
11 = Selects CMPxD input pin

bit 5 **EXTREF:** Enable External Reference bit
1 = External source provides reference to the DAC (maximum DAC voltage determined by the external voltage source)
0 = Internal reference sources provide reference to the DAC (maximum DAC voltage determined by the RANGE bit setting)

bit 4 **Reserved:** Read as '0'

bit 3 **CMPSTAT:** Current State of Comparator Output Including CMPPOL Selection bit

bit 2 **Reserved:** Read as '0'

bit 1 **CMPPOL:** Comparator Output Polarity Control bit
1 = Output is inverted
0 = Output is non-inverted

bit 0 **RANGE:** Selects DAC Output Voltage Range bit
1 = High Range: Max DAC Value = AV_{DD}/2, 1.65V at 3.3V AV_{DD}
0 = Low Range: Max DAC Value = INTREF**(2)**

Note 1: DACOUT can be associated only with a single comparator at any given time. The software must ensure that multiple comparators do not enable the DAC output by setting their respective DACOE bit.

2: Refer to the DAC Module Specifications (Table 24-43) in **Section 24.0 "Electrical Characteristics"** for the INTREF value.

TABLE 21-2: dsPIC33F CONFIGURATION BITS DESCRIPTION

Bit Field	Register	RTSP Effect	Description
BWRP	FBS	Immediate	Boot Segment Program Flash Write Protection bit 1 = Boot segment can be written 0 = Boot segment is write-protected
BSS<2:0>	FBS	Immediate	Boot Segment Program Flash Code Protection Size bits x11 = No boot program Flash segment Boot Space is 256 Instruction Words (except interrupt vectors): 110 = Standard security; boot program Flash segment ends at 0x0003FE 010 = High security; boot program Flash segment ends at 0x0003FE Boot Space is 768 Instruction Words (except interrupt vectors): 101 = Standard security; boot program Flash segment ends at 0x0007FE 001 = High security; boot program Flash segment ends at 0x0007FE Boot Space is 1792 Instruction Words (except interrupt vectors): 100 = Standard security; boot program Flash segment ends at 0x000FFE 000 = High security; boot program Flash segment ends at 0x000FFE
GSS<1:0>	FGS	Immediate	General Segment Code-Protect bits 11 = User program memory is not code-protected 10 = Standard security 0x = High security
GWRP	FGS	Immediate	General Segment Write-Protect bit 1 = User program memory is not write-protected 0 = User program memory is write-protected
IESO	FOSCSEL	Immediate	Two-speed Oscillator Start-up Enable bit 1 = Start-up device with FRC, then automatically switch to the user-selected oscillator source when ready 0 = Start-up device with user-selected oscillator source
FNOSC<2:0>	FOSCSEL	If clock switch is enabled, RTSP effect is on any device Reset; otherwise, Immediate	Initial Oscillator Source Selection bits 111 = Internal Fast RC (FRC) Oscillator with Postscaler 110 = Internal Fast RC (FRC) Oscillator with Divide-by-16 101 = LPRC Oscillator 100 = Reserved 011 = Primary (XT, HS, EC) Oscillator with PLL 010 = Primary (XT, HS, EC) Oscillator 001 = Internal Fast RC (FRC) Oscillator with PLL 000 = FRC Oscillator
FCKSM<1:0>	FOSC	Immediate	Clock Switching Mode bits 1x = Clock switching is disabled, Fail-Safe Clock Monitor is disabled 01 = Clock switching is enabled, Fail-Safe Clock Monitor is disabled 00 = Clock switching is enabled, Fail-Safe Clock Monitor is enabled
IOL1WAY	FOSC	Immediate	Peripheral Pin Select Configuration bit 1 = Allows only one reconfiguration 0 = Allows multiple reconfigurations
OSCIOFNC	FOSC	Immediate	OSC2 Pin Function bit (except in XT and HS modes) 1 = OSC2 is the clock output 0 = OSC2 is the general purpose digital I/O pin

TABLE 24-7: DC CHARACTERISTICS: POWER-DOWN CURRENT (I_{PD})

DC CHARACTERISTICS			Standard Operating Conditions: 3.0V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial -40°C ≤ TA ≤ +125°C for Extended			
Parameter No.	**Typical(1)**	**Max**	**Units**	**Conditions**		
Power-Down Current (I_{PD})(2,4)						
DC60d	125	500	µA	-40°C	3.3V	Base Power-Down Current
DC60a	135	500	µA	+25°C		
DC60b	235	500	µA	+85°C		
DC60c	565	950	µA	+125°C		
DC61d	40	50	µA	-40°C	3.3V	Watchdog Timer Current: ΔI_{WDT}(3)
DC61a	40	50	µA	+25°C		
DC61b	40	50	µA	+85°C		
DC61c	80	90	µA	+125°C		

Note 1: Data in the Typical column is at 3.3V, +25°C unless otherwise stated.

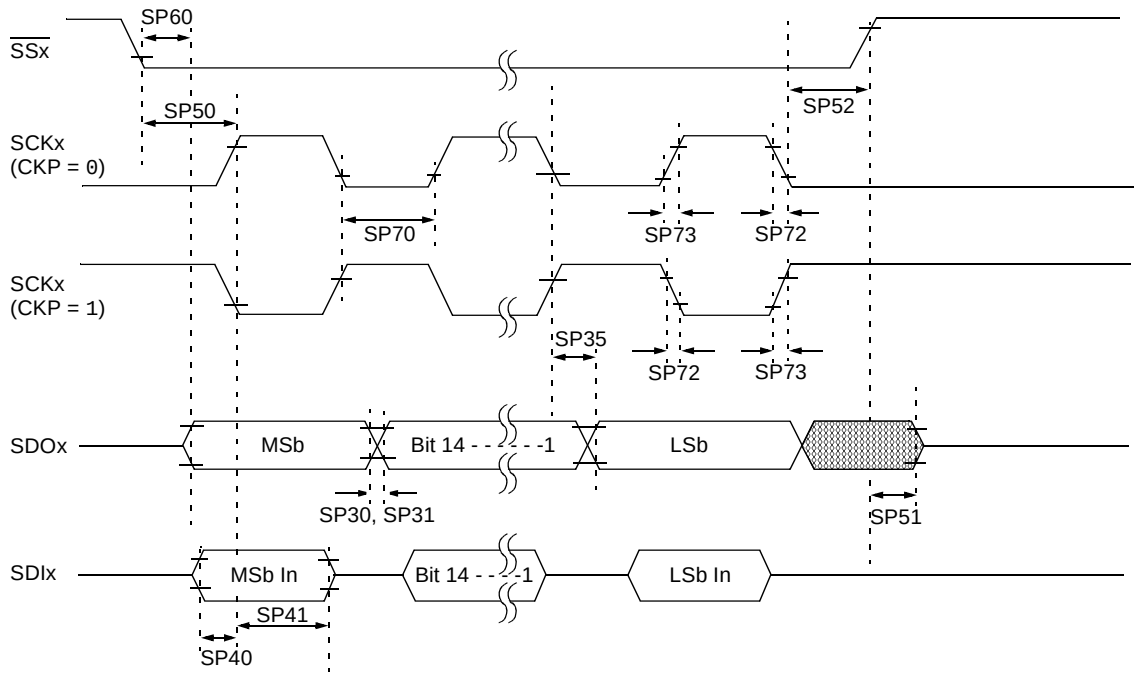
2: I_{PD} (Sleep) current is measured as follows:

- CPU core is off, oscillator is configured in EC mode and external clock active, OSC1 is driven with external square wave from rail-to-rail (EC clock overshoot/undershoot < 250 mV required)
- CLKO is configured as an I/O input pin in the Configuration Word
- All I/O pins are configured as inputs and pulled to V_{SS}
- $\overline{MCLR}$ = V_{DD}, WDT and FSCM are disabled
- All peripheral modules are disabled (PMDx bits are all ones)
- The VREGS bit (RCON<8>) = 0 (i.e., core regulator is set to stand-by while the device is in Sleep mode)
- JTAG disabled

3: The Δ current is the additional current consumed when the WDT module is enabled. This current should be added to the base I_{PD} current.

4: These currents are measured on the device containing the most memory in this family.

FIGURE 24-15: SPIx SLAVE MODE (FULL-DUPLEX, CKE = 1, CKP = 0, SMP = 0) TIMING CHARACTERISTICS



Note: Refer to Figure 24-1 for load conditions.

TABLE 24-44: DAC OUTPUT BUFFER DC SPECIFICATIONS

DC CHARACTERISTICS			Standard Operating Conditions (see Note 1): 3.0V to 3.6V Operating temperature: -40°C ≤ TA ≤ +85°C for Industrial -40°C ≤ TA ≤ +125°C for Extended				
Param. No.	**Symbol**	**Characteristic**	**Min**	**Typ**	**Max**	**Units**	**Comments**
DA10	RLOAD	Resistive Output Load Impedance	3K	—	—	Ω	
DA11	CLOAD	Output Load Capacitance	—	20	35	pF	
DA12	IOUT	Output Current Drive Strength	-1740	±1400	+1770	μA	Sink and source
DA13	VRANGE	Full Output Drive Strength Voltage Range	AVSS + 250 mV	—	AVDD – 900 mV	V	
DA14	VLRANGE	Output Drive Voltage Range at Reduced Current Drive of 50 μA	AVSS + 50 mV	—	AVDD – 500 mV	V	
DA15	IDD	Current Consumed when Module is Enabled, High-Power Mode	369	626	948	μA	Module will always consume this current even if no load is connected to the output
DA16	ROUTON	Output Impedance when Module is Enabled	—	1200	—	Ω	

Note 1: Module is functional at VBOR < VDD < VDDMIN, but with degraded performance. Module functionality is tested but not characterized.

NOTES:

28-Lead Plastic Quad Flat, No Lead Package (MX) - 6x6x0.5mm Body [UQFN]
Ultra-Thin with 0.40 x 0.60 mm Terminal Width/Length and Corner Anchors

Note:	For the most current package drawings, please see the Microchip Packaging Specification located at http://www.microchip.com/packaging
