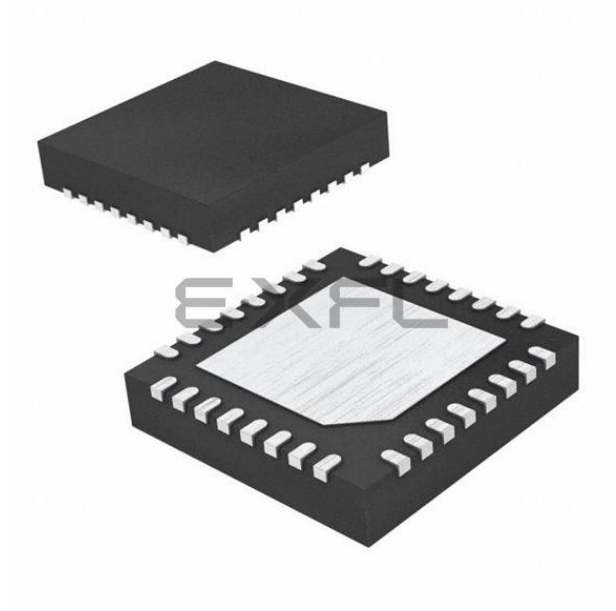
# Microchip Technology - DSPIC33FJ16GS402-H/MM Datasheet



**Welcome to E-XFL.COM**

## What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

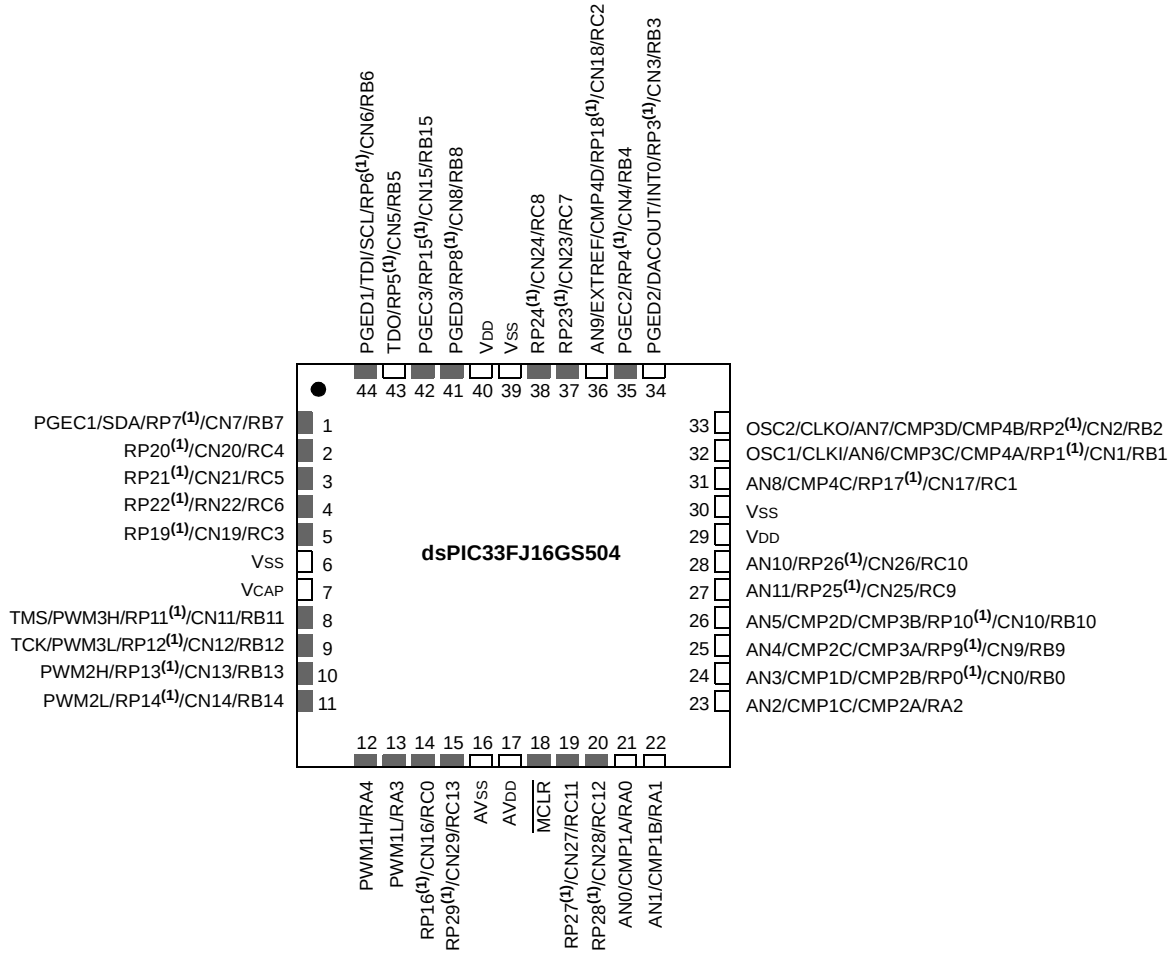
## Applications of "Embedded - Microcontrollers"

| Details | |
|---|---|
| Product Status | Active |
| Core Processor | dsPIC |
| Core Size | 16-Bit |
| Speed | 40 MIPs |
| Connectivity | I²C, IrDA, LINbus, SPI, UART/USART |
| Peripherals | Brown-out Detect/Reset, POR, PWM, WDT |
| Number of I/O | 21 |
| Program Memory Size | 16KB (16K x 8) |
| Program Memory Type | FLASH |
| EEPROM Size | - |
| RAM Size | 2K x 8 |
| Voltage - Supply (Vcc/Vdd) | 3V ~ 3.6V |
| Data Converters | A/D 8x10b |
| Oscillator Type | Internal |
| Operating Temperature | -40°C ~ 150°C (TA) |
| Mounting Type | Surface Mount |
| Package / Case | 28-VQFN Exposed Pad |
| Supplier Device Package | 28-QFN-S (6x6) |
| Purchase URL | https://www.e-xfl.com/product-detail/microchip-technology/dspic33fj16gs402-h-mm |

## Pin Diagrams (Continued)

**44-Pin QFN(2)**

■ = Pins are up to 5V tolerant



**Note 1:** The RPn pins can be used by any remappable peripheral. See **Table 1** for the list of available peripherals.

**2:** The metal plane at the bottom of the device is not connected to any pins and is recommended to be connected to VSS externally.

**FIGURE 2-4: DIGITAL PFC**

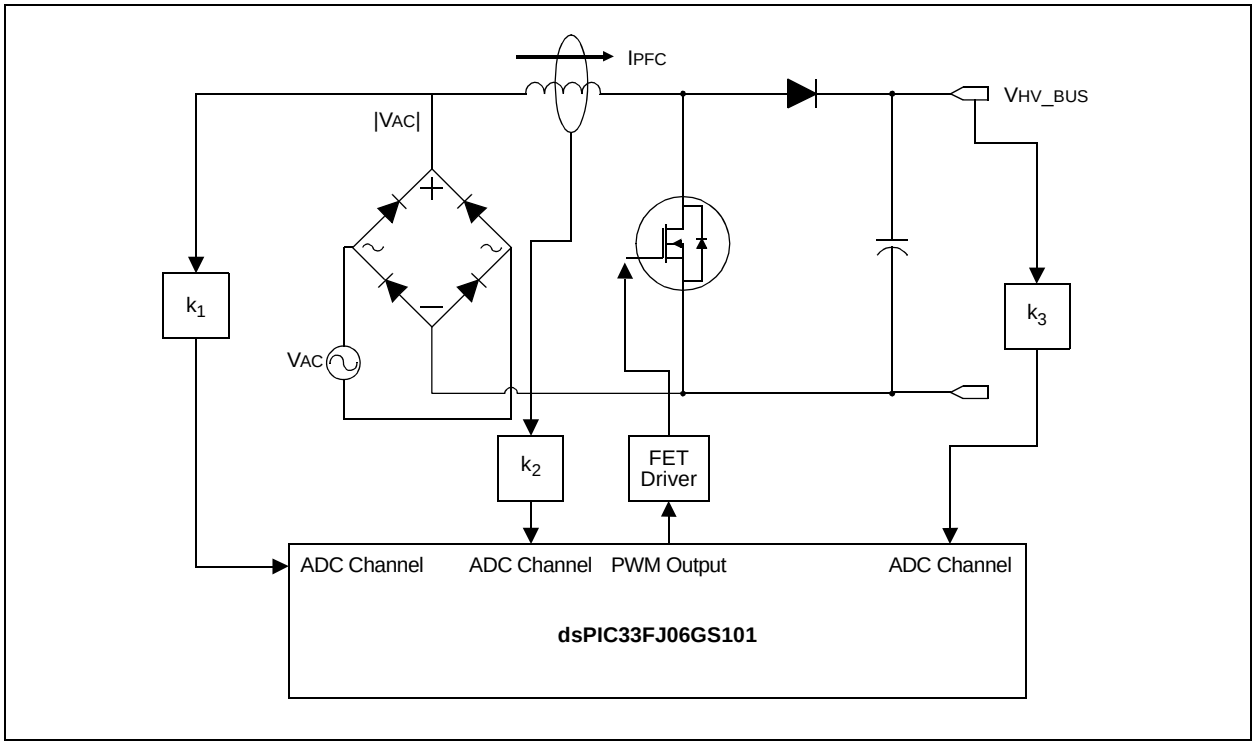


**FIGURE 2-5: BOOST CONVERTER IMPLEMENTATION**

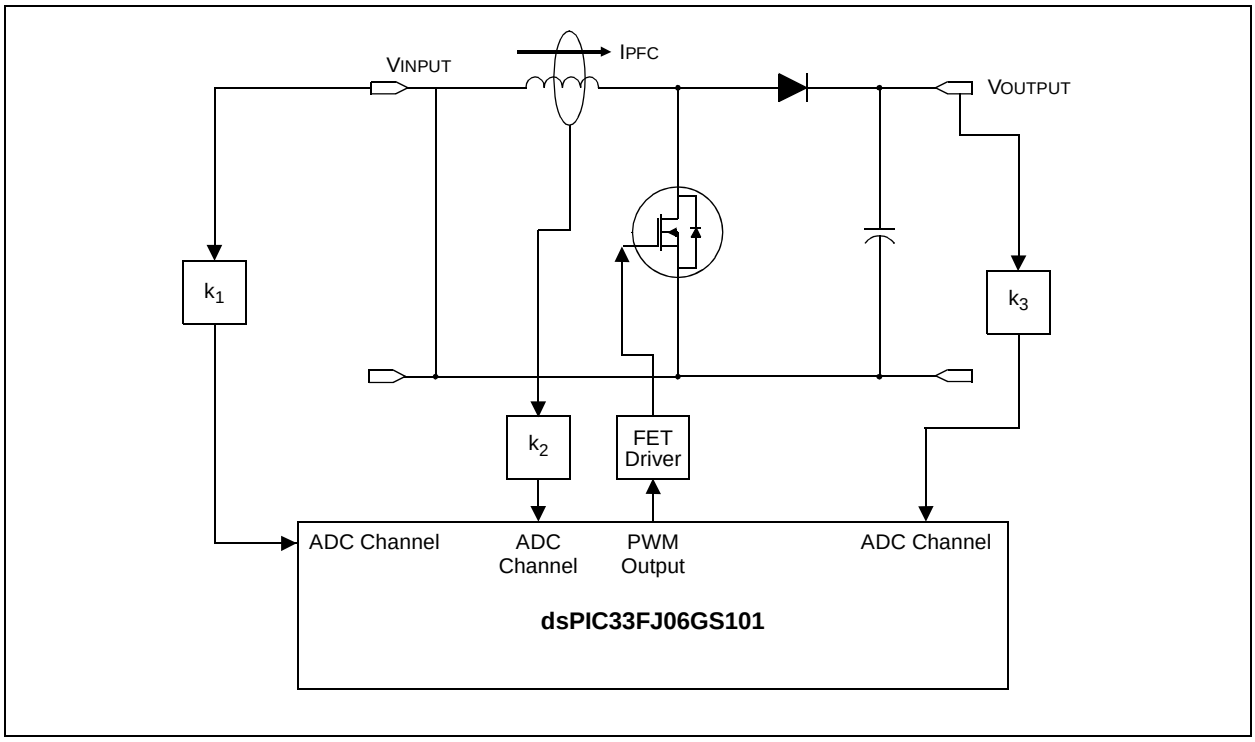

The SAC and SAC.R instructions store either a truncated (SAC), or rounded (SAC.R) version of the contents of the target accumulator to data memory via the X bus, subject to data saturation (see **Section 3.6.3.2 "Data Space Write Saturation"**). For the MAC class of instructions, the accumulator write-back operation functions in the same manner, addressing combined MCU (X and Y) data space though the X bus. For this class of instructions, the data is always subject to rounding.

#### 3.6.3.2 Data Space Write Saturation

In addition to adder/subtracter saturation, writes to data space can also be saturated, but without affecting the contents of the source accumulator. The data space write saturation logic block accepts a 16-bit, 1.15 fractional value from the round logic block as its input, together with overflow status from the original source (accumulator) and the 16-bit round adder. These inputs are combined and used to select the appropriate 1.15 fractional value as output to write to data space memory.

If the SATDW bit in the CORCON register is set, data (after rounding or truncation) is tested for overflow and adjusted accordingly:

- For input data greater than 0x007FFF, data written to memory is forced to the maximum positive 1.15 value, 0x7FFF.
- For input data less than 0xFF8000, data written to memory is forced to the maximum negative 1.15 value, 0x8000.

The Most Significant bit of the source (bit 39) is used to determine the sign of the operand being tested.

If the SATDW bit in the CORCON register is not set, the input data is always passed through unmodified under all conditions.

### 3.6.4 BARREL SHIFTER

The barrel shifter can perform up to 16-bit arithmetic or logic right shifts, or up to 16-bit left shifts in a single cycle. The source can be either of the two DSP accumulators or the X bus (to support multi-bit shifts of register or memory data).

The shifter requires a signed binary value to determine both the magnitude (number of bits) and direction of the shift operation. A positive value shifts the operand right. A negative value shifts the operand left. A value of '0' does not modify the operand.

The barrel shifter is 40 bits wide, thereby obtaining a 40-bit result for DSP shift operations and a 16-bit result for MCU shift operations. Data from the X bus is presented to the barrel shifter between bit positions 16 and 31 for right shifts, and between bit positions 0 and 16 for left shifts.

## 7.0 INTERRUPT CONTROLLER

**Note 1:** This data sheet summarizes the features of the dsPIC33FJ06GS101/X02 and dsPIC33FJ16GSX02/X04 families of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **"Interrupts (Part IV)"** (DS70300) in the "*dsPIC33F/PIC24H Family Reference Manual*", which is available on the Microchip web site (www.microchip.com).

**2:** Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 "Memory Organization"** in this data sheet for device-specific register and bit information.

The dsPIC33FJ06GS101/X02 and dsPIC33FJ16GSX02/X04 interrupt controller reduces the numerous peripheral interrupt request signals to a single interrupt request signal to the dsPIC33FJ06GS101/X02 and dsPIC33FJ16GSX02/X04 CPU. It has the following features:

- Up to eight processor exceptions and software traps
- Seven user-selectable priority levels
- Interrupt Vector Table (IVT) with up to 118 vectors
- A unique vector for each interrupt or exception source
- Fixed priority within a specified user priority level
- Alternate Interrupt Vector Table (AIVT) for debug support
- Fixed interrupt entry and return latencies

## 7.1 Interrupt Vector Table

The Interrupt Vector Table (IVT) is shown in Figure 7-1. The IVT resides in program memory, starting at location 000004h. The IVT contains 126 vectors, consisting of eight nonmaskable trap vectors, plus up to 118 sources of interrupt. In general, each interrupt source has its own vector. Each interrupt vector contains a 24-bit-wide address. The value programmed into each interrupt vector location is the starting address of the associated Interrupt Service Routine (ISR).

Interrupt vectors are prioritized in terms of their natural priority. This priority is linked to their position in the vector table. Lower addresses generally have a higher natural priority. For example, the interrupt associated with Vector 0 will take priority over interrupts at any other vector address.

The dsPIC33FJ06GS101/X02 and dsPIC33FJ16GSX02/X04 devices implement up to 35 unique interrupts and 4 non-maskable traps. These are summarized in Table 7-1.

### 7.1.1 ALTERNATE INTERRUPT VECTOR TABLE

The Alternate Interrupt Vector Table (AIVT) is located after the IVT, as shown in Figure 7-1. Access to the AIVT is provided by the ALTIVT control bit (INTCON2<15>). If the ALTIVT bit is set, all interrupt and exception processes use the alternate vectors instead of the default vectors. The alternate vectors are organized in the same manner as the default vectors.

The AIVT supports debugging by providing a means to switch between an application and a support environment without requiring the interrupt vectors to be reprogrammed. This feature also enables switching between applications for evaluation of different software algorithms at run time. If the AIVT is not needed, the AIVT should be programmed with the same addresses used in the IVT.

## 7.2 Reset Sequence

A device Reset is not a true exception because the interrupt controller is not involved in the Reset process. The dsPIC33FJ06GS101/X02 and dsPIC33FJ16GSX02/X04 devices clear their registers in response to a Reset, which forces the PC to zero. The Digital Signal Controller then begins program execution at location, 0x000000. A `GOTO` instruction at the Reset address can redirect program execution to the appropriate start-up routine.

**Note:** Any unimplemented or unused vector locations in the IVT and AIVT should be programmed with the address of a default interrupt handler routine that contains a `RESET` instruction.

### 9.2.2 IDLE MODE

The following occur in Idle mode:

- The CPU stops executing instructions
- The WDT is automatically cleared
- The system clock source remains active. By default, all peripheral modules continue to operate normally from the system clock source, but can also be selectively disabled (see **Section 9.4 "Peripheral Module Disable"**).
- If the WDT or FSCM is enabled, the LPRC also remains active

The device will wake-up from Idle mode on any of these events:

- Any interrupt that is individually enabled
- Any device Reset
- A WDT time-out

On wake-up from Idle mode, the clock is reapplied to the CPU and instruction execution will begin (2-4 clock cycles later), starting with the instruction following the PWRSAV instruction, or the first instruction in the ISR.

### 9.2.3 INTERRUPTS COINCIDENT WITH POWER SAVE INSTRUCTIONS

Any interrupt that coincides with the execution of a PWRSAV instruction is held off until entry into Sleep or Idle mode has completed. The device then wakes up from Sleep or Idle mode.

## 9.3 Doze Mode

The preferred strategies for reducing power consumption are changing clock speed and invoking one of the power-saving modes. In some circumstances, this may not be practical. For example, it may be necessary for an application to maintain uninterrupted synchronous communication, even while it is doing nothing else. Reducing system clock speed can introduce communication errors, while using a power-saving mode can stop communications completely.

Doze mode is a simple and effective alternative method to reduce power consumption while the device is still executing code. In this mode, the system clock continues to operate from the same source and at the same speed. Peripheral modules continue to be clocked at the same speed, while the CPU clock speed is reduced. Synchronization between the two clock domains is maintained, allowing the peripherals to access the SFRs while the CPU executes code at a slower rate.

Doze mode is enabled by setting the DOZEN bit (CLKDIV<11>). The ratio between peripheral and core clock speed is determined by the DOZE<2:0> bits (CLKDIV<14:12>). There are eight possible configurations, from 1:1 to 1:128, with 1:1 being the default setting.

Programs can use Doze mode to selectively reduce power consumption in event-driven applications. This allows clock-sensitive functions, such as synchronous communications, to continue without interruption while the CPU idles, waiting for something to invoke an interrupt routine. An automatic return to full-speed CPU operation on interrupts can be enabled by setting the ROI bit (CLKDIV<15>). By default, interrupt events have no effect on Doze mode operation.

For example, suppose the device is operating at 20 MIPS and the CAN module has been configured for 500 kbps based on this device operating speed. If the device is placed in Doze mode with a clock frequency ratio of 1:4, the CAN module continues to communicate at the required bit rate of 500 kbps, but the CPU now starts executing instructions at a frequency of 5 MIPS.

## 9.4 Peripheral Module Disable

The Peripheral Module Disable (PMD) registers provide a method to disable a peripheral module by stopping all clock sources supplied to that module. When a peripheral is disabled using the appropriate PMD control bit, the peripheral is in a minimum power consumption state. The control and status registers associated with the peripheral are also disabled, so writes to those registers will have no effect and read values will be invalid.

A peripheral module is enabled only if both the associated bit in the PMD register is cleared and the peripheral is supported by the specific dsPIC® DSC variant. If the peripheral is present in the device, it is enabled in the PMD register by default.

| | |
|---|---|
| **Note:** | If a PMD bit is set, the corresponding module is disabled after a delay of one instruction cycle. Similarly, if a PMD bit is cleared, the corresponding module is enabled after a delay of one instruction cycle (assuming the module control registers are already configured to enable module operation). |

## 12.0 TIMER2/3 FEATURES

**Note 1:** This data sheet summarizes the features of the dsPIC33FJ06GS101/X02 and dsPIC33FJ16GSX02/X04 families of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **"Timers"** (DS70205) in the *"dsPIC33F/PIC24H Family Reference Manual"*, which is available on the Microchip web site (www.microchip.com).

**2:** Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 "Memory Organization"** in this data sheet for device-specific register and bit information.

Timer2 is a Type B timer that offers the following major features:

- A Type B timer can be concatenated with a Type C timer to form a 32-bit timer
- External clock input (TxCK) is always synchronized to the internal device clock and the clock synchronization is performed after the prescaler.

Figure 12-1 shows a block diagram of the Type B timer.

Timer3 is a Type C timer that offers the following major features:

- A Type C timer can be concatenated with a Type B timer to form a 32-bit timer
- The external clock input (TxCK) is always synchronized to the internal device clock and the clock synchronization is performed before the prescaler

A block diagram of the Type C timer is shown in Figure 12-2.

**Note:** Timer3 is not available on all devices.

**FIGURE 12-1: TYPE B TIMER BLOCK DIAGRAM (x = 2)**

| R = Readable bit | W = Writable bit | U = Unimplemented bit, read as '0' | |
| -n = Value at POR | '1' = Bit is set | '0' = Bit is cleared | x = Bit is unknown |

bit 15 **SPIEN:** SPIx Enable bit
1 = Enables module and configures SCKx, SDOx, SDIx and $\overline{SSx}$ as serial port pins
0 = Disables module

bit 14 **Unimplemented:** Read as '0'

bit 13 **SPISIDL:** SPIx Stop in Idle Mode bit
1 = Discontinues module operation when device enters Idle mode
0 = Continues module operation in Idle mode

bit 12-7 **Unimplemented:** Read as '0'

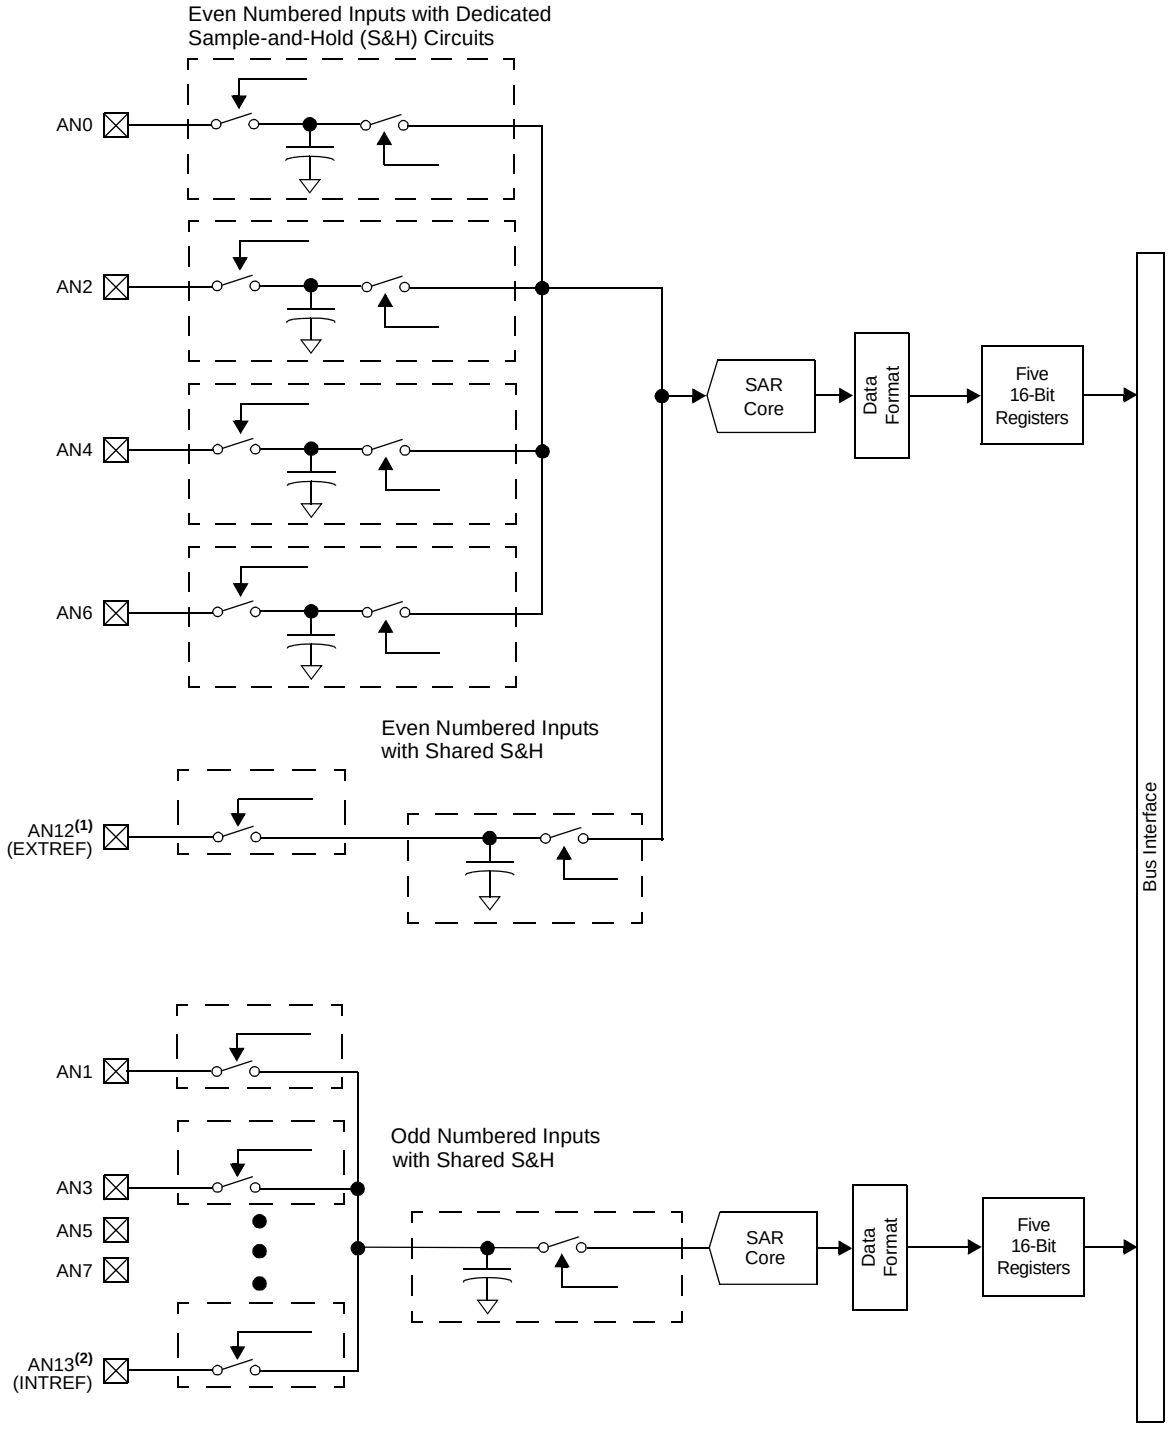
bit 6 **SPIROV:** SPIx Receive Overflow Flag bit
1 = A new byte/word is completely received and discarded. The user software has not read the previous data in the SPIxBUF register.
0 = No overflow has occurred

bit 5-2 **Unimplemented:** Read as '0'

bit 1 **SPITBF:** SPIx Transmit Buffer Full Status bit
1 = Transmit not yet started, SPIxTXB is full
0 = Transmit started, SPIxTXB is empty. Automatically set in hardware when CPU writes the SPIxBUF location, loading SPIxTXB. Automatically cleared in hardware when the SPIx module transfers data from SPIxTXB to SPIxSR.

bit 0 **SPIRBF:** SPIx Receive Buffer Full Status bit
1 = Receive complete, SPIxRXB is full
0 = Receive is not complete, SPIxRXB is empty. Automatically set in hardware when SPIx transfers data from SPIxSR to SPIxRXB. Automatically cleared in hardware when core reads the SPIxBUF location, reading SPIxRXB.

**FIGURE 19-5: ADC BLOCK DIAGRAM FOR dsPIC33FJ16GS502 DEVICES WITH TWO SARS**



**Note 1:** AN12 (EXTREF) is an internal analog input. To measure the voltage at AN12 (EXTREF), an analog comparator must be enabled and EXTREF must be selected as the comparator reference.

**2:** AN13 (INTREF) is an internal analog input and is not available on a pin.

**NOTES:**

**TABLE 25-5: DC CHARACTERISTICS: I/O PIN OUTPUT SPECIFICATIONS**

| DC CHARACTERISTICS | | | Standard Operating Conditions: 3.0V to 3.6V (unless otherwise stated)<br>Operating temperature -40°C ≤ TA ≤ +150°C for High Temperature | | | | |
|---|---|---|---|---|---|---|---|
| **Param.** | **Symbol** | **Characteristic** | **Min.** | **Typ.** | **Max.** | **Units** | **Conditions** |
| DO10 | VOL | **Output Low Voltage**<br>I/O Pins:<br>4x Sink Driver Pins – RA0-RA2, RB0-RB2, RB5-RB10, RB15, RC1, RC2, RC9, RC10 | — | — | 0.4 | V | IOL ≤ 3.6 mA, VDD = 3.3V<br>See **Note 1** |
| | | **Output Low Voltage**<br>I/O Pins:<br>8x Sink Driver Pins – RC0, RC3-RC8, RC11-RC13 | — | — | 0.4 | V | IOL ≤ 6 mA, VDD = 3.3V<br>See **Note 1** |
| | | **Output Low Voltage**<br>I/O Pins:<br>16x Sink Driver Pins – RA3, RA4, RB3, RB4, RB11-RB14 | — | — | 0.4 | V | IOL ≤ 12 mA, VDD = 3.3V<br>See **Note 1** |
| DO20 | VOH | **Output High Voltage**<br>I/O Pins:<br>4x Source Driver Pins – RA0-RA2, RB0-RB2, RB5-RB10, RB15, RC1, RC2, RC9, RC10 | 2.4 | — | — | V | IOL ≥ -4 mA, VDD = 3.3V<br>See **Note 1** |
| | | **Output High Voltage**<br>I/O Pins:<br>8x Source Driver Pins – RC0, RC3-RC8, RC11-RC13 | 2.4 | — | — | V | IOL ≥ -8 mA, VDD = 3.3V<br>See **Note 1** |
| | | **Output High Voltage**<br>I/O Pins:<br>16x Source Driver Pins – RA3, RA4, RB3, RB4, RB11-RB14 | 2.4 | — | — | V | IOL ≥ -16 mA, VDD = 3.3V<br>See **Note 1** |
| DO20A | VOH1 | **Output High Voltage**<br>I/O Pins:<br>4x Source Driver Pins – RA0-RA2, RB0-RB2, RB5-RB10, RB15, RC1, RC2, RC9, RC10 | 1.5 | — | — | V | IOH ≥ -3.9 mA, VDD = 3.3V<br>See **Note 1** |
| | | | 2.0 | — | — | | IOH ≥ -3.7 mA, VDD = 3.3V<br>See **Note 1** |
| | | | 3.0 | — | — | | IOH ≥ -2 mA, VDD = 3.3V<br>See **Note 1** |
| | | **Output High Voltage**<br>I/O Pins:<br>8x Source Driver Pins – RC0, RC3-RC8, RC11-RC13 | 1.5 | — | — | V | IOH ≥ -7.5 mA, VDD = 3.3V<br>See **Note 1** |
| | | | 2.0 | — | — | | IOH ≥ -6.8 mA, VDD = 3.3V<br>See **Note 1** |
| | | | 3.0 | — | — | | IOH ≥ -3 mA, VDD = 3.3V<br>See **Note 1** |
