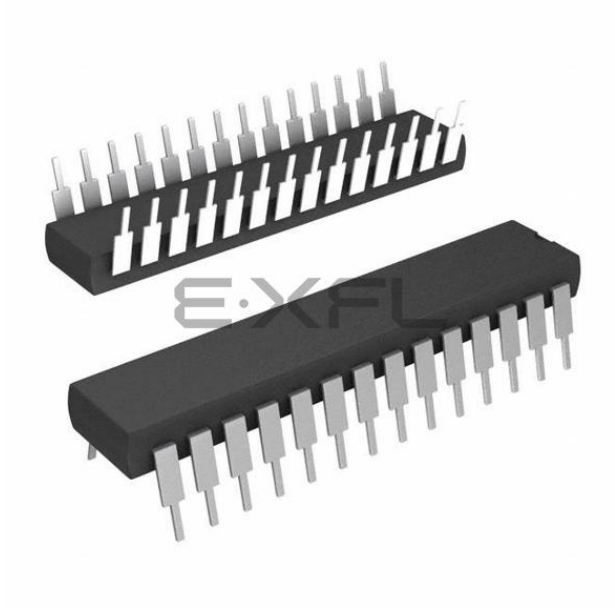
Microchip Technology - DSPIC33FJ16GS502-50I/SP Datasheet



Welcome to E-XFL.COM

What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Active
Core Processor	dsPIC
Core Size	16-Bit
Speed	50 MIPs
Connectivity	I²C, IrDA, LINbus, SPI, UART/USART
Peripherals	Brown-out Detect/Reset, POR, PWM, WDT
Number of I/O	21
Program Memory Size	16KB (16K x 8)
Program Memory Type	FLASH
EEPROM Size	-
RAM Size	2K x 8
Voltage - Supply (Vcc/Vdd)	3V ~ 3.6V
Data Converters	A/D 16x10b; D/A 4x10b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 85°C (TA)
Mounting Type	Through Hole
Package / Case	28-DIP (0.300", 7.62mm)
Supplier Device Package	28-SPDIP
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/dspic33fj16gs502-50i-sp

4.2 Data Address Space

The dsPIC33FJ06GS101/X02 and dsPIC33FJ16GSX02/X04 CPU has a separate, 16-bit-wide data memory space. The data space is accessed using separate Address Generation Units (AGUs) for read and write operations. The data memory maps is shown in Figure 4-3.

All Effective Addresses (EAs) in the data memory space are 16 bits wide and point to bytes within the data space. This arrangement gives a data space address range of 64 Kbytes or 32K words. The lower half of the data memory space (that is, when EA<15> = 0) is used for implemented memory addresses, while the upper half (EA<15> = 1) is reserved for the Program Space Visibility area (see **Section 4.6.3 "Reading Data from Program Memory Using Program Space Visibility"**).

dsPIC33FJ06GS101/X02 and dsPIC33FJ16GSX02/X04 devices implement up to 2 Kbytes of data memory. Should an EA point to a location outside of this area, an all zero word or byte will be returned.

4.2.1 DATA SPACE WIDTH

The data memory space is organized in byte addressable, 16-bit wide blocks. Data is aligned in data memory and registers as 16-bit words, but all data space EAs resolve to bytes. The Least Significant Bytes (LSBs) of each word have even addresses, while the Most Significant Bytes (MSBs) have odd addresses.

4.2.2 DATA MEMORY ORGANIZATION AND ALIGNMENT

To maintain backward compatibility with PIC® MCU devices and improve data space memory usage efficiency, the dsPIC33FJ06GS101/X02 and dsPIC33FJ16GSX02/X04 instruction set supports both word and byte operations. As a consequence of byte accessibility, all Effective Address calculations are internally scaled to step through word-aligned memory. For example, the core recognizes that Post-Modified Register Indirect Addressing mode [Ws++] that results in a value of Ws + 1 for byte operations and Ws + 2 for word operations.

Data byte reads will read the complete word that contains the byte, using the LSB of any EA to determine which byte to select. The selected byte is placed onto the LSB of the data path. That is, data memory and registers are organized as two parallel byte-wide entities with shared (word) address decode but separate write lines. Data byte writes only write to the corresponding side of the array or register that matches the byte address.

All word accesses must be aligned to an even address. Misaligned word data fetches are not supported, so care must be taken when mixing byte and word operations, or translating from 8-bit MCU code. If a misaligned read or write is attempted, an address error trap is generated. If the error occurred on a read, the instruction underway is completed. If the error occurred on a write, the instruction is executed but the write does not occur. In either case, a trap is then executed, allowing the system and/or user application to examine the machine state prior to execution of the address Fault.

All byte loads into any W register are loaded into the Least Significant Byte. The Most Significant Byte is not modified.

A sign-extend (SE) instruction is provided to allow user applications to translate 8-bit signed data to 16-bit signed values. Alternatively, for 16-bit unsigned data, user applications can clear the MSB of any W register by executing a zero-extend (ZE) instruction on the appropriate address.

4.2.3 SFR SPACE

The first 2 Kbytes of the Near Data Space, from 0x0000 to 0x07FF, is primarily occupied by Special Function Registers (SFRs). These are used by the dsPIC33FJ06GS101/X02 and dsPIC33FJ16GSX02/X04 core and peripheral modules for controlling the operation of the device.

SFRs are distributed among the modules that they control, and are generally grouped together by module. Much of the SFR space contains unused addresses; these are read as '0'.

Note:	The actual set of peripheral features and interrupts varies by the device. Refer to the corresponding device tables and pinout diagrams for device-specific information.

4.2.4 NEAR DATA SPACE

The 8-Kbyte area, between 0x0000 and 0x1FFF, is referred to as the Near Data Space. Locations in this space are directly addressable via a 13-bit absolute address field within all memory direct instructions. Additionally, the whole data space is addressable using MOV instructions, which support Memory Direct Addressing mode with a 16-bit address field or by using Indirect Addressing mode using a Working register as an Address Pointer.

TABLE 4-48: FUNDAMENTAL ADDRESSING MODES SUPPORTED

Addressing Mode	Description
File Register Direct	The address of the file register is specified explicitly.
Register Direct	The contents of a register are accessed directly.
Register Indirect	The contents of Wn forms the Effective Address (EA).
Register Indirect Post-Modified	The contents of Wn forms the EA. Wn is post-modified (incremented or decremented) by a constant value.
Register Indirect Pre-Modified	Wn is pre-modified (incremented or decremented) by a signed constant value to form the EA.
Register Indirect with Register Offset (Register Indexed)	The sum of Wn and Wb forms the EA.
Register Indirect with Literal Offset	The sum of Wn and a literal forms the EA.

4.3.3 MOVE AND ACCUMULATOR INSTRUCTIONS

Move instructions and the DSP accumulator class of instructions to provide a greater addressing flexibility than other instructions. In addition to the addressing modes supported by most MCU instructions, move and accumulator instructions also support Register Indirect with Register Offset Addressing mode, also referred to as Register Indexed mode.

Note: For the MOV instructions, the addressing mode specified in the instruction can differ for the source and destination EA. However, the 4-bit Wb (register offset) field is shared by both source and destination (but typically only used by one).

In summary, the following addressing modes are supported by move and accumulator instructions:

- Register Direct
- Register Indirect
- Register Indirect Post-modified
- Register Indirect Pre-modified
- Register Indirect with Register Offset (Indexed)
- Register Indirect with Literal Offset
- 8-bit Literal
- 16-bit Literal

Note: Not all instructions support all the addressing modes given above. Individual instructions may support different subsets of these addressing modes.

4.3.4 MAC INSTRUCTIONS

The dual source operand DSP instructions (CLR, ED, EDAC, MAC, MPY, MPY.N, MOVSAC and MSC), also referred to as MAC instructions, use a simplified set of addressing modes to allow the user application to effectively manipulate the Data Pointers through register indirect tables.

The two-source operand prefetch registers must be members of the set {W8, W9, W10, W11}. For data reads, W8 and W9 are always directed to the X RAGU, and W10 and W11 are always directed to the Y AGU. The Effective Addresses generated (before and after modification) must, therefore, be valid addresses within X data space for W8 and W9 and Y data space for W10 and W11.

Note: Register Indirect with Register Offset Addressing mode is available only for W9 (in X space) and W11 (in Y space).

In summary, the following addressing modes are supported by the MAC class of instructions:

- Register Indirect
- Register Indirect Post-Modified by 2
- Register Indirect Post-Modified by 4
- Register Indirect Post-Modified by 6
- Register Indirect with Register Offset (Indexed)

4.3.5 OTHER INSTRUCTIONS

Besides the addressing modes outlined previously, some instructions use literal constants of various sizes. For example, BRA (branch) instructions use 16-bit signed literals to specify the branch destination directly, whereas the DISI instruction uses a 14-bit unsigned literal field. In some instructions, such as ADD Acc, the source of an operand or result is implied by the opcode itself. Certain operations, such as NOP, do not have any operands.

7.0 INTERRUPT CONTROLLER

Note 1: This data sheet summarizes the features of the dsPIC33FJ06GS101/X02 and dsPIC33FJ16GSX02/X04 families of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **"Interrupts (Part IV)"** (DS70300) in the "*dsPIC33F/PIC24H Family Reference Manual*", which is available on the Microchip web site (www.microchip.com).

2: Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 "Memory Organization"** in this data sheet for device-specific register and bit information.

The dsPIC33FJ06GS101/X02 and dsPIC33FJ16GSX02/X04 interrupt controller reduces the numerous peripheral interrupt request signals to a single interrupt request signal to the dsPIC33FJ06GS101/X02 and dsPIC33FJ16GSX02/X04 CPU. It has the following features:

- Up to eight processor exceptions and software traps
- Seven user-selectable priority levels
- Interrupt Vector Table (IVT) with up to 118 vectors
- A unique vector for each interrupt or exception source
- Fixed priority within a specified user priority level
- Alternate Interrupt Vector Table (AIVT) for debug support
- Fixed interrupt entry and return latencies

7.1 Interrupt Vector Table

The Interrupt Vector Table (IVT) is shown in Figure 7-1. The IVT resides in program memory, starting at location 000004h. The IVT contains 126 vectors, consisting of eight nonmaskable trap vectors, plus up to 118 sources of interrupt. In general, each interrupt source has its own vector. Each interrupt vector contains a 24-bit-wide address. The value programmed into each interrupt vector location is the starting address of the associated Interrupt Service Routine (ISR).

Interrupt vectors are prioritized in terms of their natural priority. This priority is linked to their position in the vector table. Lower addresses generally have a higher natural priority. For example, the interrupt associated with Vector 0 will take priority over interrupts at any other vector address.

The dsPIC33FJ06GS101/X02 and dsPIC33FJ16GSX02/X04 devices implement up to 35 unique interrupts and 4 non-maskable traps. These are summarized in Table 7-1.

7.1.1 ALTERNATE INTERRUPT VECTOR TABLE

The Alternate Interrupt Vector Table (AIVT) is located after the IVT, as shown in Figure 7-1. Access to the AIVT is provided by the ALTIVT control bit (INTCON2<15>). If the ALTIVT bit is set, all interrupt and exception processes use the alternate vectors instead of the default vectors. The alternate vectors are organized in the same manner as the default vectors.

The AIVT supports debugging by providing a means to switch between an application and a support environment without requiring the interrupt vectors to be reprogrammed. This feature also enables switching between applications for evaluation of different software algorithms at run time. If the AIVT is not needed, the AIVT should be programmed with the same addresses used in the IVT.

7.2 Reset Sequence

A device Reset is not a true exception because the interrupt controller is not involved in the Reset process. The dsPIC33FJ06GS101/X02 and dsPIC33FJ16GSX02/X04 devices clear their registers in response to a Reset, which forces the PC to zero. The Digital Signal Controller then begins program execution at location, 0x000000. A GOTO instruction at the Reset address can redirect program execution to the appropriate start-up routine.

Note: Any unimplemented or unused vector locations in the IVT and AIVT should be programmed with the address of a default interrupt handler routine that contains a RESET instruction.

REGISTER 7-20: IPC1: INTERRUPT PRIORITY CONTROL REGISTER 1

111 = Interrupt is Priority 7 (highest priority interrupt)
•
•
•
001 = Interrupt is Priority 1
000 = Interrupt source is disabled

bit 3-0 **Unimplemented:** Read as '0'

REGISTER 8-1: OSCCON: OSCILLATOR CONTROL REGISTER(1,2) (CONTINUED)

bit 3 **CF:** Clock Fail Detect bit (read/clear by application)
1 = FSCM has detected clock failure
0 = FSCM has not detected clock failure

bit 2-1 **Unimplemented:** Read as '0'

bit 0 **OSWEN:** Oscillator Switch Enable bit
1 = Request oscillator switch to selection specified by NOSC<2:0> bits
0 = Oscillator switch is complete

Note 1: Writes to this register require an unlock sequence. Refer to **"Oscillator (Part IV)"** (DS70307) in the *"dsPIC33F/PIC24H Family Reference Manual"* (available from the Microchip web site) for details.

2: This register is reset only on a Power-on Reset (POR).

3: Direct clock switches between any primary oscillator mode with PLL and FRCPLL mode are not permitted. This applies to clock switches in either direction. In these instances, the application must switch to FRC mode as a transition clock source between the two PLL modes.

10.2 Open-Drain Configuration

In addition to the PORTx, LATx and TRISx registers for data control, some digital-only port pins can also be individually configured for either digital or open-drain output. This is controlled by the Open-Drain Control register, ODCx, associated with each port. Setting any of the bits configures the corresponding pin to act as an open-drain output.

The open-drain feature allows the generation of outputs higher than VDD (for example, 5V) on any desired 5V tolerant pins by using external pull-up resistors. The maximum open-drain voltage allowed is the same as the maximum VIH specification.

Refer to **"Pin Diagrams"** for the available pins and their functionality.

10.3 Configuring Analog Port Pins

The ADPCFG and TRISx registers control the operation of the Analog-to-Digital (A/D) port pins. The port pins that are to function as analog inputs must have their corresponding TRISx bit set (input). If the TRISx bit is cleared (output), the digital output level (VOH or VOL) will be converted.

The ADPCFG register has a default value of 0x0000; therefore, all pins that share ANx functions are analog (not digital) by default.

When the PORTx register is read, all pins configured as analog input channels will read as cleared (a low level).

Pins configured as digital inputs will not convert an analog input. Analog levels on any pin defined as a digital input (including the ANx pins) can cause the input buffer to consume current that exceeds the device specifications.

10.4 I/O Port Write/Read Timing

One instruction cycle is required between a port direction change or port write operation and a read operation of the same port. Typically, this instruction would be a NOP. An example is shown in Example 10-1.

10.5 Input Change Notification

The Input Change Notification (ICN) function of the I/O ports allows the dsPIC33FJ06GS101/X02 and dsPIC33FJ16GSX02/X04 devices to generate interrupt requests to the processor in response to a Change-of-State (COS) on selected input pins. This feature can detect input Change-of-States even in Sleep mode, when the clocks are disabled. Depending on the device pin count, up to 30 external signals (CNx pin) can be selected (enabled) for generating an interrupt request on a Change-of-State.

Four control registers are associated with the CN module. The CNEN1 and CNEN2 registers contain the interrupt enable control bits for each of the CN input pins. Setting any of these bits enables a CN interrupt for the corresponding pins.

Each CN pin also has a weak pull-up connected to it. The pull-ups act as a current source connected to the pin, and eliminate the need for external resistors when the push button or keypad devices are connected. The pull-ups are enabled separately using the CNPU1 and CNPU2 registers, which contain the control bits for each of the CN pins. Setting any of the control bits enables the weak pull-ups for the corresponding pins.

Note:	Pull-ups on Change Notification pins should always be disabled when the port pin is configured as a digital output.

EQUATION 10-1: PORT WRITE/READ EXAMPLE

```
MOV   0xFF00, W0          ; Configure PORTB<15:8> as inputs
MOV   W0, TRISBB          ; and PORTB<7:0> as outputs
NOP                       ; Delay 1 cycle
BTSS  PORTB, #13          ; Next Instruction
```

REGISTER 15-14: IOCONx: PWMx I/O CONTROL REGISTER

R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0

bit 15							bit 8

R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0
OVRDAT1	OVRDAT0	FLTDAT1(2)	FLTDAT0(2)	CLDAT1(2)	CLDAT0(2)	SWAP	OSYNC
bit 7							bit 0

Legend:			
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 15 **PENH:** PWMH Output Pin Ownership bit
1 = PWM module controls the PWMxH pin
0 = GPIO module controls the PWMxH pin

bit 14 **PENL:** PWML Output Pin Ownership bit
1 = PWM module controls the PWMxL pin
0 = GPIO module controls the PWMxL pin

bit 13 **POLH:** PWMH Output Pin Polarity bit
1 = PWMxH pin is active-low
0 = PWMxH pin is active-high

bit 12 **POLL:** PWML Output Pin Polarity bit
1 = PWMxL pin is active-low
0 = PWMxL pin is active-high

bit 11-10 **PMOD<1:0>:** PWM # I/O Pin Mode bits(1)
11 = PWM I/O pin pair is in the True Independent Output mode
10 = PWM I/O pin pair is in the Push-Pull Output mode
01 = PWM I/O pin pair is in the Redundant Output mode
00 = PWM I/O pin pair is in the Complementary Output mode

bit 9 **OVRENH:** Override Enable for PWMxH Pin bit
1 = OVRDAT<1> provides data for output on the PWMxH pin
0 = PWM generator provides data for the PWMxH pin

bit 8 **OVRENL:** Override Enable for PWMxL Pin bit
1 = OVRDAT<0> provides data for output on the PWMxL pin
0 = PWM generator provides data for the PWMxL pin

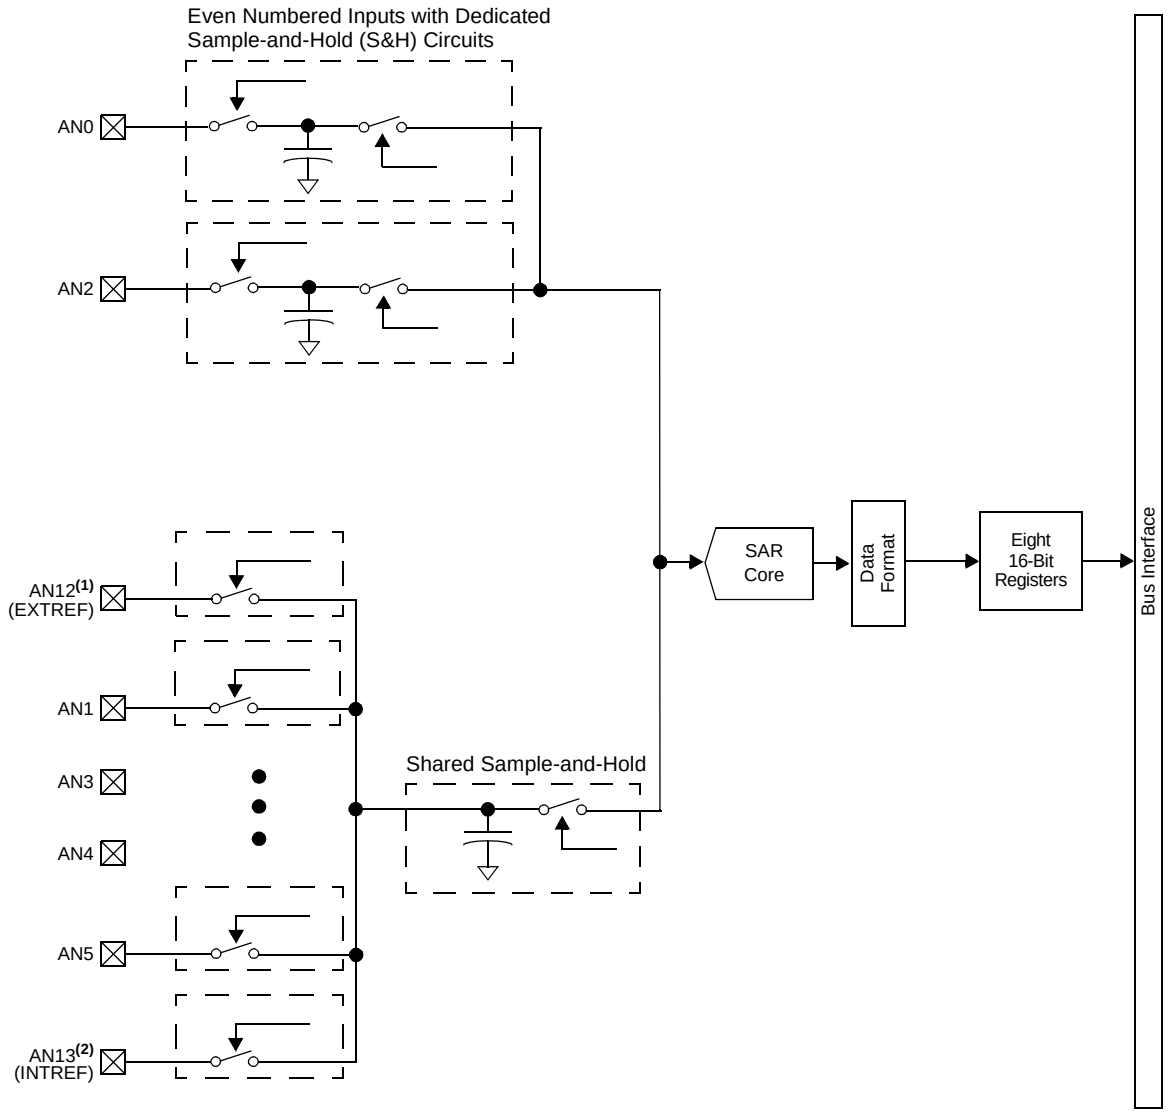
bit 7-6 **OVRDAT<1:0>:** Data for PWMxH and PWMxL Pins if Override is Enabled bits
If OVERENH = 1, then OVRDAT<1> provides data for PWMxH
If OVERENL = 1, then OVRDAT<0> provides data for PWMxL

bit 5-4 **FLTDAT<1:0>:** State for PWMxH and PWMxL Pins if FLTMOD is Enabled bits(2)
FCLCONx<IFLTMOD> = 0: Normal Fault mode:
If Fault is active, then FLTDAT<1> provides the state for PWMxH
If Fault is active, then FLTDAT<0> provides the state for PWMxL
FCLCONx<IFLTMOD> = 1: Independent Fault mode:
If current-limit is active, then FLTDAT<1> provides data for PWMxH
If Fault is active, then FLTDAT<0> provides the state for PWMxL

Note 1: These bits should be changed only when PTEN = 0. Changing the clock selection during operation will yield unpredictable results.

2: The state represents the active/inactive state of the PWM module depending on the POLH and POLL bit settings.

FIGURE 19-3: ADC BLOCK DIAGRAM FOR dsPIC33FJ06GS202 DEVICES WITH ONE SAR



Note 1: AN12 (EXTREF) is an internal analog input. To measure the voltage at AN12 (EXTREF), an analog comparator must be enabled and EXTREF must be selected as the comparator reference.

2: AN13 (INTREF) is an internal analog input and is not available on a pin.

REGISTER 19-1: ADCON: ANALOG-TO-DIGITAL CONTROL REGISTER

R/W-0	U-0	R/W-0	R/W-0	U-0	R/W-0	U-0	R/W-0
ADON	—	ADSIDL	SLOWCLK(1)	—	GSWTRG	—	FORM(1)
bit 15							bit 8

R/W-0	R/W-0	R/W-0	R/W-0	U-0	R/W-0	R/W-1	R/W-1
EIE(1)	ORDER(1,2)	SEQSAMP(1,2)	ASYNCSAMP(1)	—	ADCS2(1)	ADCS1(1)	ADCS0(1)
bit 7							bit 0

Legend:			
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 15 **ADON:** Analog-to-Digital Operating Mode bit
1 = Analog-to-Digital Converter (ADC) module is operating
0 = ADC Converter is off

bit 14 **Unimplemented:** Read as '0'

bit 13 **ADSIDL:** ADC Stop in Idle Mode bit
1 = Discontinues module operation when device enters Idle mode
0 = Continues module operation in Idle mode

bit 12 **SLOWCLK:** Enable The Slow Clock Divider bit(1)
1 = ADC is clocked by the auxiliary PLL (ACLK)
0 = ADC is clock by the primary PLL (FVCO)

bit 11 **Unimplemented:** Read as '0'

bit 10 **GSWTRG:** Global Software Trigger bit
When this bit is set by the user, it will trigger conversions if selected by the TRGSRC<4:0> bits in the ADCPCx registers. This bit must be cleared by the user prior to initiating another global trigger (i.e., this bit is not auto-clearing).

bit 9 **Unimplemented:** Read as '0'

bit 8 **FORM:** Data Output Format bit(1)
1 = Fractional (DOUT = dddd dddd dd00 0000)
0 = Integer (DOUT = 0000 00dd dddd dddd)

bit 7 **EIE:** Early Interrupt Enable bit(1)
1 = Interrupt is generated after first conversion is completed
0 = Interrupt is generated after second conversion is completed

bit 6 **ORDER:** Conversion Order bit(1,2)
1 = Odd numbered analog input is converted first, followed by conversion of even numbered input
0 = Even numbered analog input is converted first, followed by conversion of odd numbered input

bit 5 **SEQSAMP:** Sequential Sample Enable bit(1,2)
1 = Shared Sample-and-Hold (S&H) circuit is sampled at the start of the second conversion if ORDER = 0. If ORDER = 1, then the shared S&H is sampled at the start of the first conversion.
0 = Shared S&H is sampled at the same time the dedicated S&H is sampled if the shared S&H is not currently busy with an existing conversion process. If the shared S&H is busy at the time the dedicated S&H is sampled, then the shared S&H will sample at the start of the new conversion cycle.

Note 1: These control bits can only be changed while ADC is disabled (ADON = 0).
2: These bits are only available on devices with one SAR.

REGISTER 19-7: ADCPC2: ANALOG-TO-DIGITAL CONVERT PAIR CONTROL REGISTER 2(1)

R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0

bit 15							bit 8

R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0
IRQEN4	PEND4	SWTRG4	TRGSRC44	TRGSRC43	TRGSRC42	TRGSRC41	TRGSRC40
bit 7							bit 0

Legend:			
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 15 **IRQEN5:** Interrupt Request Enable 5 bit
1 = Enables IRQ generation when requested conversion of Channels AN11 and AN10 is completed
0 = IRQ is not generated

bit 14 **PEND5:** Pending Conversion Status 5 bit
1 = Conversion of Channels AN11 and AN10 is pending; set when selected trigger is asserted
0 = Conversion is complete

bit 13 **SWTRG5:** Software Trigger 5 bit
1 = Starts conversion of AN11 and AN10 (if selected by the TRGSRCx bits)(2)
This bit is automatically cleared by hardware when the PEND5 bit is set.
0 = Conversion has not started

Note 1: This register is only implemented in the dsPIC33FJ16GS504 devices.

2: The trigger source must be set as a global software trigger prior to setting this bit to '1'. If other conversions are in progress, then the conversion will be performed when the conversion resources are available.

TABLE 22-2: INSTRUCTION SET OVERVIEW (CONTINUED)

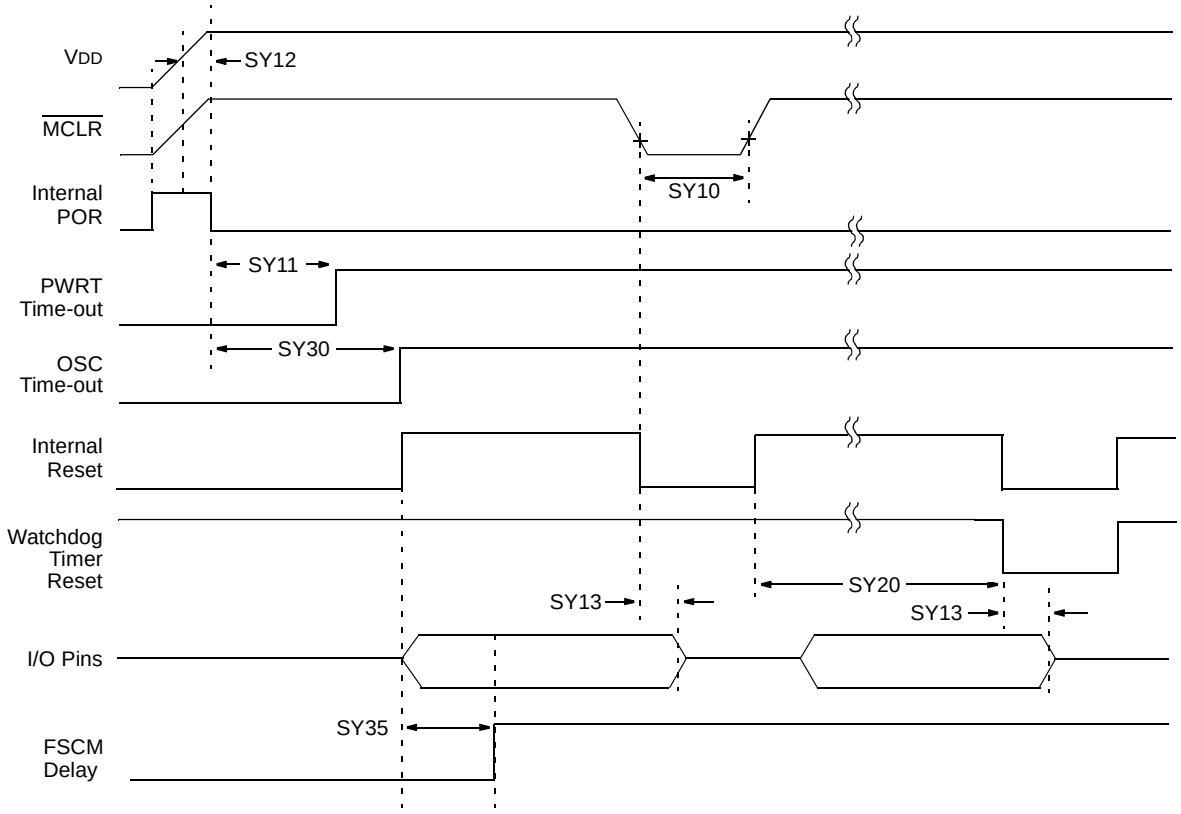
TABLE 24-10: DC CHARACTERISTICS: I/O PIN OUTPUT SPECIFICATIONS

DC CHARACTERISTICS			Standard Operating Conditions: 3.0V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial -40°C ≤ TA ≤ +125°C for Extended				
Param.	**Symbol**	**Characteristic**	**Min.**	**Typ.**	**Max.**	**Units**	**Conditions**
DO10	VOL	**Output Low Voltage** I/O Pins: 4x Sink Driver Pins – RA0-RA2, RB0-RB2, RB5-RB10, RB15, RC1, RC2, RC9, RC10	—	—	0.4	V	IOL ≤ 6 mA, VDD = 3.3V See **Note 1**
		Output Low Voltage I/O Pins: 8x Sink Driver Pins – RC0, RC3-RC8, RC11-RC13	—	—	0.4	V	IOL ≤ 10 mA, VDD = 3.3V See **Note 1**
		Output Low Voltage I/O Pins: 16x Sink Driver Pins – RA3, RA4, RB3, RB4, RB11-RB14	—	—	0.4	V	IOL ≤ 18 mA, VDD = 3.3V See **Note 1**
DO20	VOH	**Output High Voltage** I/O Pins: 4x Source Driver Pins – RA0-RA2, RB0-RB2, RB5-RB10, RB15, RC1, RC2, RC9, RC10	2.4	—	—	V	IOH ≥ -6 mA, VDD = 3.3V See **Note 1**
		Output High Voltage I/O Pins: 8x Source Driver Pins – RC0, RC3-RC8, RC11-RC13	2.4	—	—	V	IOH ≥ -10 mA, VDD = 3.3V See **Note 1**
		Output High Voltage I/O Pins: 16x Source Driver Pins – RA3, RA4, RB3, RB4, RB11-RB14	2.4	—	—	V	IOH ≥ -18 mA, VDD = 3.3V See **Note 1**
DO20A	VOH1	**Output High Voltage** I/O Pins: 4x Source Driver Pins – RA0-RA2, RB0-RB2, RB5-RB10, RB15, RC1, RC2, RC9, RC10	1.5	—	—	V	IOH ≥ -12 mA, VDD = 3.3V See **Note 1**
			2.0	—	—		IOH ≥ -11 mA, VDD = 3.3V See **Note 1**
			3.0	—	—		IOH ≥ -3 mA, VDD = 3.3V See **Note 1**
		Output High Voltage 8x Source Driver Pins – RC0, RC3-RC8, RC11-RC13	1.5	—	—	V	IOH ≥ -16 mA, VDD = 3.3V See **Note 1**
			2.0	—	—		IOH ≥ -12 mA, VDD = 3.3V See **Note 1**
			3.0	—	—		IOH ≥ -4 mA, VDD = 3.3V See **Note 1**
		Output High Voltage I/O Pins: 16x Source Driver Pins – RA3, RA4, RB3, RB4, RB11-RB14	1.5	—	—	V	IOH ≥ -30 mA, VDD = 3.3V See **Note 1**
			2.0	—	—		IOH ≥ -25 mA, VDD = 3.3V See **Note 1**
			3.0	—	—		IOH ≥ -8 mA, VDD = 3.3V See **Note 1**

Note 1: Parameters are characterized, but not tested.

FIGURE 24-4: RESET, WATCHDOG TIMER, OSCILLATOR START-UP TIMER AND POWER-UP TIMER TIMING CHARACTERISTICS



Note: Refer to Figure 24-1 for load conditions.

TABLE 25-6: DC CHARACTERISTICS: PROGRAM MEMORY

DC CHARACTERISTICS			Standard Operating Conditions: 3.0V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +150°C for High Temperature				
Param No.	**Symbol**	**Characteristic(1)**	**Min**	**Typ**	**Max**	**Units**	**Conditions**
		Program Flash Memory					
HD130	EP	Cell Endurance	10,000	—	—	E/W	-40°C to +150°C(2)
HD134	TRETD	Characteristic Retention	20	—	—	Year	1000 E/W cycles or less and no other specifications are violated

Note 1: These parameters are assured by design, but are not characterized or tested in manufacturing.

2: Programming of the Flash memory is not allowed above +125°C.

TABLE 26-3: DC CHARACTERISTICS: IDLE CURRENT (I_{IDLE})

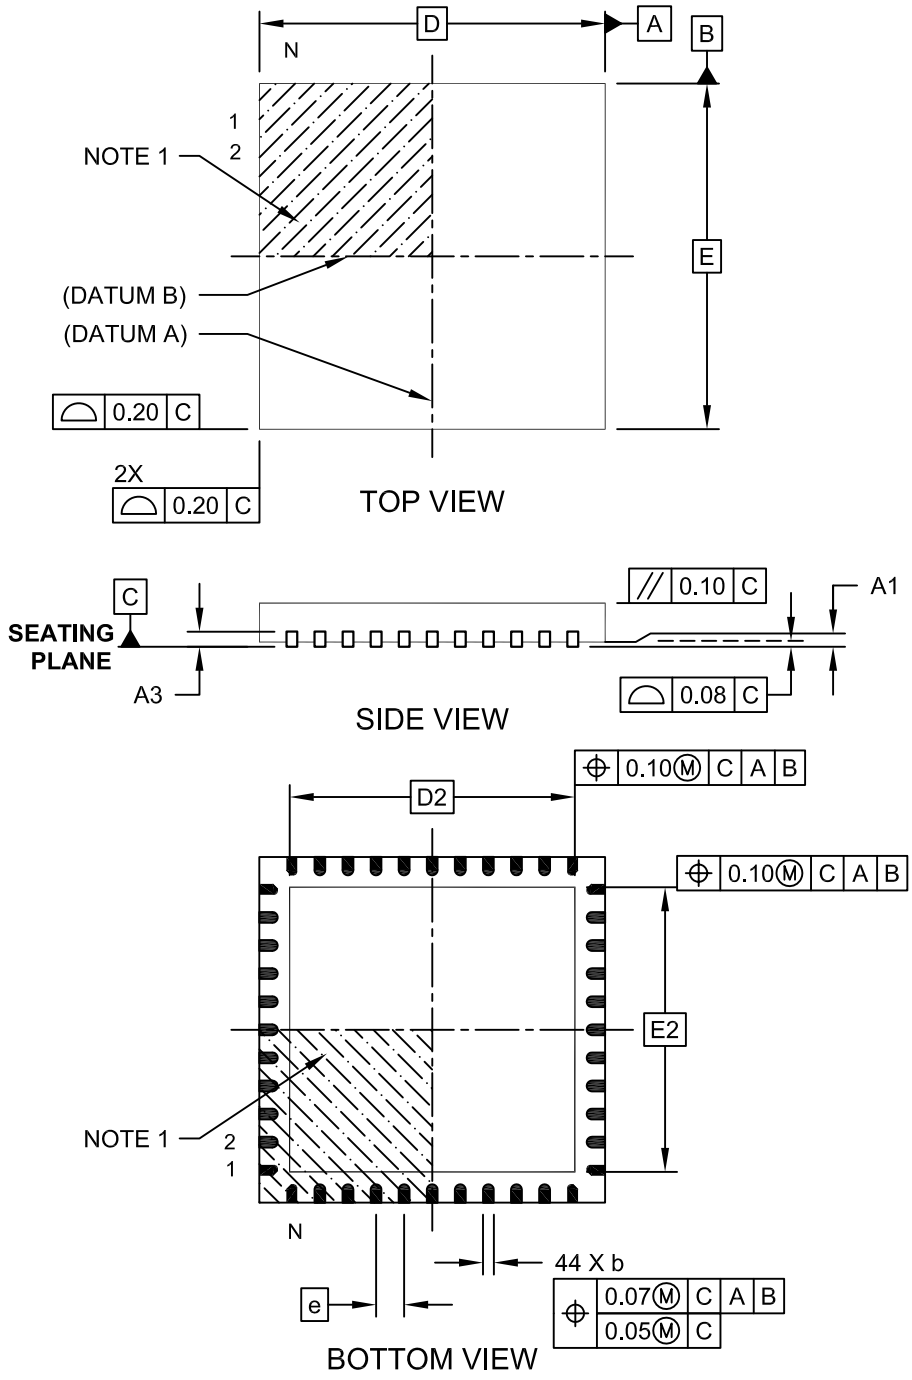
DC CHARACTERISTICS			Standard Operating Conditions: 3.0V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial			
Parameter No.	**Typical**	**Max**	**Units**	**Conditions**		
Idle Current (I_{IDLE}): Core Off, Clock On Base Current(1)						
MDC45d	64	105	mA	-40°C	3.3V	50 MIPS
MDC45a	64	105	mA	+25°C		
MDC45b	64	105	mA	+85°C		

Note 1: Base Idle current (I_{IDLE}) is measured as follows:

- CPU core is off, oscillator is configured in EC mode and external clock active, OSC1 is driven with external square wave from rail-to-rail (EC clock overshoot/undershoot < 250 mV required)
- CLKO is configured as an I/O input pin in the Configuration Word
- All I/O pins are configured as inputs and pulled to VSS
- $\overline{MCLR}$ = VDD, WDT and FSCM are disabled
- No peripheral modules are operating; however, every peripheral is being clocked (all PMDx bits are zeroed)
- The NVMSIDL bit (NVMCON<12>) = 1 (i.e., Flash regulator is set to standby while the device is in Idle mode)
- JTAG is disabled

44-Lead Plastic Quad Flat, No Lead Package (ML) - 8x8 mm Body [QFN]

Note: For the most current package drawings, please see the Microchip Packaging Specification located at http://www.microchip.com/packaging



Microchip Technology Drawing C04-103C Sheet 1 of 2

Revision E (December 2009)

The revision includes the following global update:

- Added Note 2 to the shaded table that appears at the beginning of each chapter. This new note provides information regarding the availability of registers and their associated bits

This revision also includes minor typographical and formatting changes throughout the data sheet text.

All other major changes are referenced by their respective section in the following table.

TABLE A-3: MAJOR SECTION UPDATES

Section Name	Update Description
"16-bit Microcontrollers and Digital Signal Controllers (up to 16-Kbyte Flash and up to 2-Kbyte SRAM) with High-Speed PWM, ADC and Comparators"	Changed CN6 to CN5 on pin 16 of dsPIC33FJ16GS502 28-pin SPDIP, SOIC pin diagram.
Section 2.0 "Guidelines for Getting Started with 16-bit Digital Signal Controllers"	Removed the 10 Ohm resistor from Figure 2-1.
Section 4.0 "Memory Organization"	Renamed bit 13 of the REFOCON SFR in the System Control Register Map from ROSIDL to ROSSLP and changed the All Resets value from '0000' to '2300' for the ACLKCON SFR (see 4-41).
Section 8.0 "Oscillator Configuration"	Updated the default reset values from R/W-0 to R/W-1 for the SELACLK and APSTSCLR<2:0> bits in the ACLKCON register (see Register 8-5). Renamed the ROSIDL bit to ROSSLP in the REFOCON register (see Register 8-6).
Section 9.0 "Power-Saving Features"	Updated the last paragraph of **Section 9.2.2 "Idle Mode"** to clarify when instruction execution begins. Added Note 1 to the PMD1 register (see Register 9-1).
Section 10.0 "I/O Ports"	Changed the reference to digital-only pins to 5V tolerant pins in the second paragraph of **Section 10.2 "Open-Drain Configuration"**.
Section 15.0 "High-Speed PWM"	Updated the smallest pulse width value from 0x0008 to 0x0009 in Note 1 of the shaded note that follows the MDC register (see Register 15-5). Updated the smallest pulse width value from 0x0008 to 0x0009 and the maximum pulse width value from 0x0FFEF to 0x0008 in Note 2 of the shaded note that follows the PDCx and SDCx registers (see Register 15-7 and Register 15-8). Added Note 2 and updated the FLTDAT<1:0> and CLDAT<1:0> bits, changing the word 'data' to 'state' in the IOCONx register (see Register 15-14).
Section 18.0 "Universal Asynchronous Receiver Transmitter (UART)"	Updated the two baud rate range features to: 10 Mbps to 38 bps at 40 MIPS.
