Welcome to E-XFL.COM

Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications,

Details

Product Status	Active
Number of LABs/CLBs	160
Number of Logic Elements/Cells	1280
Total RAM Bits	65536
Number of I/O	21
Number of Gates	-
Voltage - Supply	2.375V ~ 3.465V
Mounting Type	Surface Mount
Operating Temperature	0°C ~ 85°C (TJ)
Package / Case	32-UFQFN Exposed Pad
Supplier Device Package	32-QFN (5x5)
Purchase URL	https://www.e-xfl.com/product-detail/lattice-semiconductor/lcmxo2-1200hc-4sg32c

Introduction

The MachXO2 family of ultra low power, instant-on, non-volatile PLDs has six devices with densities ranging from 256 to 6864 Look-Up Tables (LUTs). In addition to LUT-based, low-cost programmable logic these devices feature Embedded Block RAM (EBR), Distributed RAM, User Flash Memory (UFM), Phase Locked Loops (PLLs), pre-engineered source synchronous I/O support, advanced configuration support including dual-boot capability and hardened versions of commonly used functions such as SPI controller, I^{2}C controller and timer/counter. These features allow these devices to be used in low cost, high volume consumer and system applications.

The MachXO2 devices are designed on a 65 nm non-volatile low power process. The device architecture has several features such as programmable low swing differential I/Os and the ability to turn off I/O banks, on-chip PLLs and oscillators dynamically. These features help manage static and dynamic power consumption resulting in low static power for all members of the family.

The MachXO2 devices are available in two versions – ultra low power (ZE) and high performance (HC and HE) devices. The ultra low power devices are offered in three speed grades –1, –2 and –3, with –3 being the fastest. Similarly, the high-performance devices are offered in three speed grades: –4, –5 and –6, with –6 being the fastest. HC devices have an internal linear voltage regulator which supports external V_{CC} supply voltages of 3.3 V or 2.5 V. ZE and HE devices only accept 1.2 V as the external V_{CC} supply voltage. With the exception of power supply voltage all three types of devices (ZE, HC and HE) are functionally compatible and pin compatible with each other.

The MachXO2 PLDs are available in a broad range of advanced halogen-free packages ranging from the space saving 2.5 mm x 2.5 mm WLCSP to the 23 mm x 23 mm fpBGA. MachXO2 devices support density migration within the same package. Table 1-1 shows the LUT densities, package and I/O options, along with other key parameters.

The pre-engineered source synchronous logic implemented in the MachXO2 device family supports a broad range of interface standards, including LPDDR, DDR, DDR2 and 7:1 gearing for display I/Os.

The MachXO2 devices offer enhanced I/O features such as drive strength control, slew rate control, PCI compatibility, bus-keeper latches, pull-up resistors, pull-down resistors, open drain outputs and hot socketing. Pull-up, pull-down and bus-keeper features are controllable on a "per-pin" basis.

A user-programmable internal oscillator is included in MachXO2 devices. The clock output from this oscillator may be divided by the timer/counter for use as clock input in functions such as LED control, key-board scanner and similar state machines.

The MachXO2 devices also provide flexible, reliable and secure configuration from on-chip Flash memory. These devices can also configure themselves from external SPI Flash or be configured by an external master through the JTAG test access port or through the I^{2}C port. Additionally, MachXO2 devices support dual-boot capability (using external Flash memory) and remote field upgrade (TransFR) capability.

Lattice provides a variety of design tools that allow complex designs to be efficiently implemented using the MachXO2 family of devices. Popular logic synthesis tools provide synthesis library support for MachXO2. Lattice design tools use the synthesis tool output along with the user-specified preferences and constraints to place and route the design in the MachXO2 device. These tools extract the timing from the routing and back-annotate it into the design for timing verification.

Lattice provides many pre-engineered IP (Intellectual Property) LatticeCORE™ modules, including a number of reference designs licensed free of charge, optimized for the MachXO2 PLD family. By using these configurable soft core IP cores as standardized blocks, users are free to concentrate on the unique aspects of their design, increasing their productivity.

Figure 2-5. Primary Clocks for MachXO2 Devices
Primary clocks for MachXO2-640U, MachXO2-1200/U and larger devices.

Note: MachXO2-640 and smaller devices do not have inputs from the Edge Clock Divider or PLL and fewer routing inputs. These devices have 17:1 muxes instead of 27:1 muxes.

Eight secondary high fanout nets are generated from eight 8:1 muxes as shown in Figure 2-6. One of the eight inputs to the secondary high fanout net input mux comes from dual function clock pins and the remaining seven come from internal routing. The maximum frequency for the secondary clock network is shown in MachXO2 External Switching Characteristics table.

This phase shift can be either programmed during configuration or can be adjusted dynamically. In dynamic mode, the PLL may lose lock after a phase adjustment on the output used as the feedback source and not relock until the t_{LOCK} parameter has been satisfied.

The MachXO2 also has a feature that allows the user to select between two different reference clock sources dynamically. This feature is implemented using the PLLREFCS primitive. The timing parameters for the PLL are shown in the sysCLOCK PLL Timing table.

The MachXO2 PLL contains a WISHBONE port feature that allows the PLL settings, including divider values, to be dynamically changed from the user logic. When using this feature the EFB block must also be instantiated in the design to allow access to the WISHBONE ports. Similar to the dynamic phase adjustment, when PLL settings are updated through the WISHBONE port the PLL may lose lock and not relock until the t_{LOCK} parameter has been satisfied. The timing parameters for the PLL are shown in the sysCLOCK PLL Timing table.

For more details on the PLL and the WISHBONE interface, see TN1199, MachXO2 sysCLOCK PLL Design and Usage Guide.

Figure 2-7. PLL Diagram
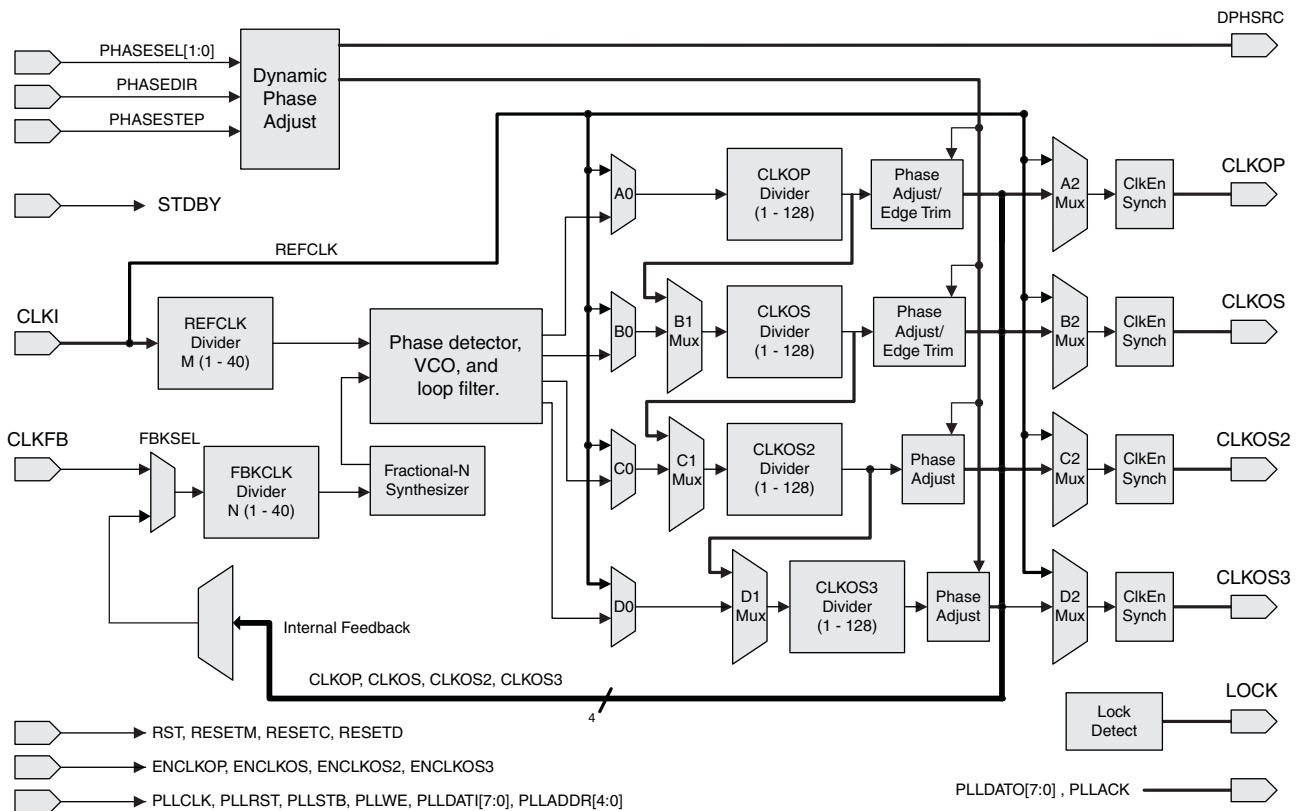

Table 2-4 provides signal descriptions of the PLL block.

Table 2-4. PLL Signal Descriptions

| Port Name	I/O	Description
CLKI	I	Input clock to PLL
CLKFB	I	Feedback clock
PHASESEL[1:0]	I	Select which output is affected by Dynamic Phase adjustment ports
PHASEDIR	I	Dynamic Phase adjustment direction
PHASESTEP	I	Dynamic Phase step – toggle shifts VCO phase adjust by one step.

Figure 2-9. Memory Core Reset
For further information on the sysMEM EBR block, please refer to TN1201, Memory Usage Guide for MachXO2 Devices.

EBR Asynchronous Reset

EBR asynchronous reset or GSR (if used) can only be applied if all clock enables are low for a clock cycle before the reset is applied and released a clock cycle after the reset is released, as shown in Figure 2-10. The GSR input to the EBR is always asynchronous.

Figure 2-10. EBR Asynchronous Reset (Including GSR) Timing Diagram
If all clock enables remain enabled, the EBR asynchronous reset or GSR may only be applied and released after the EBR read and write clock inputs are in a steady state condition for a minimum of $1/f_{MAX}$ (EBR clock). The reset release must adhere to the EBR synchronous reset setup time before the next active read or write clock edge.

If an EBR is pre-loaded during configuration, the GSR input must be disabled or the release of the GSR during device wake up must occur before the release of the device I/Os becoming active.

These instructions apply to all EBR RAM, ROM and FIFO implementations. For the EBR FIFO mode, the GSR signal is always enabled and the WE and RE signals act like the clock enable signals in Figure 2-10. The reset timing rules apply to the RPReset input versus the RE input and the RST input versus the WE and RE inputs. Both RST and RPReset are always asynchronous EBR inputs. For more details refer to TN1201, Memory Usage Guide for MachXO2 Devices.

Note that there are no reset restrictions if the EBR synchronous reset is used and the EBR GSR input is disabled.

Table 2-13. Supported Output Standards

Output Standard	V_{CCIO} (Typ.)
Single-Ended Interfaces	
LVTTL	3.3
LVCMOS33	3.3
LVCMOS25	2.5
LVCMOS18	1.8
LVCMOS15	1.5
LVCMOS12	1.2
LVCMOS33, Open Drain	—
LVCMOS25, Open Drain	—
LVCMOS18, Open Drain	—
LVCMOS15, Open Drain	—
LVCMOS12, Open Drain	—
PCI33	3.3
SSTL25 (Class I)	2.5
SSTL18 (Class I)	1.8
HSTL18(Class I)	1.8
Differential Interfaces	
LVDS[1, 2]	2.5, 3.3
BLVDS, MLVDS, RSDS [2]	2.5
LVPECL[2]	3.3
MIPI[2]	2.5
Differential SSTL18	1.8
Differential SSTL25	2.5
Differential HSTL18	1.8

1. MachXO2-640U, MachXO2-1200/U and larger devices have dedicated LVDS buffers.
2. These interfaces can be emulated with external resistors in all devices.

sysIO Buffer Banks

The numbers of banks vary between the devices of this family. MachXO2-1200U, MachXO2-2000/U and higher density devices have six I/O banks (one bank on the top, right and bottom side and three banks on the left side). The MachXO2-1200 and lower density devices have four banks (one bank per side). Figures 2-18 and 2-19 show the sysIO banks and their associated supplies for all devices.
Figure 2-21. I²C Core Block Diagram

Table 2-15 describes the signals interfacing with the I²C cores.

Table 2-15. I²C Core Signal Description

Signal Name	I/O	Description
i2c_scl	Bi-directional	Bi-directional clock line of the I²C core. The signal is an output if the I²C core is in master mode. The signal is an input if the I²C core is in slave mode. MUST be routed directly to the pre-assigned I/O of the chip. Refer to the Pinout Information section of this document for detailed pad and pin locations of I²C ports in each MachXO2 device.
i2c_sda	Bi-directional	Bi-directional data line of the I²C core. The signal is an output when data is transmitted from the I²C core. The signal is an input when data is received into the I²C core. MUST be routed directly to the pre-assigned I/O of the chip. Refer to the Pinout Information section of this document for detailed pad and pin locations of I²C ports in each MachXO2 device.
i2c_irqo	Output	Interrupt request output signal of the I²C core. The intended usage of this signal is for it to be connected to the WISHBONE master controller (i.e. a microcontroller or state machine) and request an interrupt when a specific condition is met. These conditions are described with the I²C register definitions.
cfg_wake	Output	Wake-up signal – To be connected only to the power module of the MachXO2 device. The signal is enabled only if the "Wakeup Enable" feature has been set within the EFB GUI, I²C Tab.
cfg_stdby	Output	Stand-by signal – To be connected only to the power module of the MachXO2 device. The signal is enabled only if the "Wakeup Enable" feature has been set within the EFB GUI, I²C Tab.

Hardened SPI IP Core

Every MachXO2 device has a hard SPI IP core that can be configured as a SPI master or slave. When the IP core is configured as a master it will be able to control other SPI enabled chips connected to the SPI bus. When the core is configured as the slave, the device will be able to interface to an external SPI master. The SPI IP core on MachXO2 devices supports the following functions:

- Configurable Master and Slave modes

- Full-Duplex data transfer

- Mode fault error flag with CPU interrupt capability

- Double-buffered data register

- Serial clock with programmable polarity and phase

- LSB First or MSB First Data Transfer

- Interface to custom logic through 8-bit WISHBONE interface

When implementing background programming of the on-chip Flash, care must be taken for the operation of the PLL. For devices that have two PLLs (XO2-2000U, -4000 and -7000), the system must put the RPLL (Right-side PLL) in reset state during the background Flash programming. More detailed description can be found in TN1204, MachXO2 Programming and Configuration Usage Guide.

Security and One-Time Programmable Mode (OTP)
For applications where security is important, the lack of an external bitstream provides a solution that is inherently more secure than SRAM-based FPGAs. This is further enhanced by device locking. MachXO2 devices contain security bits that, when set, prevent the readback of the SRAM configuration and non-volatile Flash memory spaces. The device can be in one of two modes:

1. Unlocked – Readback of the SRAM configuration and non-volatile Flash memory spaces is allowed.

2. Permanently Locked – The device is permanently locked.

Once set, the only way to clear the security bits is to erase the device. To further complement the security of the device, a One Time Programmable (OTP) mode is available. Once the device is set in this mode it is not possible to erase or re-program the Flash and SRAM OTP portions of the device. For more details, refer to TN1204, MachXO2 Programming and Configuration Usage Guide.

Dual Boot
MachXO2 devices can optionally boot from two patterns, a primary bitstream and a golden bitstream. If the primary bitstream is found to be corrupt while being downloaded into the SRAM, the device shall then automatically re-boot from the golden bitstream. Note that the primary bitstream must reside in the on-chip Flash. The golden image MUST reside in an external SPI Flash. For more details, refer to TN1204, MachXO2 Programming and Configuration Usage Guide.

Soft Error Detection
The SED feature is a CRC check of the SRAM cells after the device is configured. This check ensures that the SRAM cells were configured successfully. This feature is enabled by a configuration bit option. The Soft Error Detection can also be initiated in user mode via an input to the fabric. The clock for the Soft Error Detection circuit is generated using a dedicated divider. The undivided clock from the on-chip oscillator is the input to this divider. For low power applications users can switch off the Soft Error Detection circuit. For more details, refer to TN1206, MachXO2 Soft Error Detection Usage Guide.

TraceID

Each MachXO2 device contains a unique (per device), TraceID that can be used for tracking purposes or for IP security applications. The TraceID is 64 bits long. Eight out of 64 bits are user-programmable, the remaining 56 bits are factory-programmed. The TraceID is accessible through the EFB WISHBONE interface and can also be accessed through the SPI, I^{2}C, or JTAG interfaces.

Density Shifting

The MachXO2 family has been designed to enable density migration within the same package. Furthermore, the architecture ensures a high success rate when performing design migration from lower density devices to higher density devices. In many cases, it is also possible to shift a lower utilization design targeted for a high-density device to a lower density device. However, the exact details of the final resource utilization will impact the likely success in each case. When migrating from lower to higher density or higher to lower density, ensure to review all the power supplies and NC pins of the chosen devices. For more details refer to the MachXO2 migration files.

sysIO Recommended Operating Conditions

Standard	V_{CCIO} (V)			V_{REF} (V)		
	Min.	Typ.	Max.	Min.	Typ.	Max.
LVCMOS 3.3	3.135	3.3	3.6	—	—	—

HSTL18D	1.71	1.8	1.89	—	—	—

1. Inputs on-chip. Outputs are implemented with the addition of external resistors.
2. MachXO2-640U, MachXO2-1200/U and larger devices have dedicated LVDS buffers.
3. Input on the bottom bank of the MachXO2-640U, MachXO2-1200/U and larger devices only.
4. Supported only for inputs and BIDIs for all ZE devices, and –6 speed grade for HE and HC devices.

LVPECL

The MachXO2 family supports the differential LVPECL standard through emulation. This output standard is emulated using complementary LVCMOS outputs in conjunction with resistors across the driver outputs on all the devices. The LVPECL input standard is supported by the LVDS differential input buffer. The scheme shown in Differential LVPECL is one possible solution for point-to-point signals.

Figure 3-3. Differential LVPECL
Table 3-3. LVPECL DC Conditions[1]

Over Recommended Operating Conditions

Symbol	Description	Nominal	Units
Z_{OUT}	Output impedance	20	Ohms
R_S	Driver series resistor	93	Ohms
R_P	Driver parallel resistor	196	Ohms
R_T	Receiver termination	100	Ohms
V_{OH}	Output high voltage	2.05	V
V_{OL}	Output low voltage	1.25	V
V_{OD}	Output differential voltage	0.80	V
V_{CM}	Output common mode voltage	1.65	V
Z_{BACK}	Back impedance	100.5	Ohms
I_{DC}	DC output current	12.11	mA

1. For input buffer, see LVDS table.

For further information on LVPECL, BLVDS and other differential interfaces please see details of additional technical documentation at the end of the data sheet.

RSDS

The MachXO2 family supports the differential RSDS standard. The output standard is emulated using complementary LVCMOS outputs in conjunction with resistors across the driver outputs on all the devices. The RSDS input standard is supported by the LVDS differential input buffer. The scheme shown in Figure 3-4 is one possible solution for RSDS standard implementation. Use LVDS25E mode with suggested resistors for RSDS operation. Resistor values in Figure 3-4 are industry standard values for 1% resistors.

Figure 3-4. RSDS (Reduced Swing Differential Standard)
Table 3-4. RSDS DC Conditions

Parameter	Description	Typical	Units
Z_{OUT}	Output impedance	20	Ohms
R_S	Driver series resistor	294	Ohms
R_P	Driver parallel resistor	121	Ohms
R_T	Receiver termination	100	Ohms
V_{OH}	Output high voltage	1.35	V
V_{OL}	Output low voltage	1.15	V
V_{OD}	Output differential voltage	0.20	V
V_{CM}	Output common mode voltage	1.25	V
Z_{BACK}	Back impedance	101.5	Ohms
I_{DC}	DC output current	3.66	mA

Typical Building Block Function Performance – ZE Devices[1]

Pin-to-Pin Performance (LVCMOS25 12 mA Drive)

Function	–3 Timing	Units
Basic Functions		
16-bit decoder	13.9	ns
4:1 MUX	10.9	ns
16:1 MUX	12.0	ns

Register-to-Register Performance

Function	–3 Timing	Units
Basic Functions		
16:1 MUX	191	MHz
16-bit adder	134	MHz
16-bit counter	148	MHz
64-bit counter	77	MHz
Embedded Memory Functions		
1024x9 True-Dual Port RAM (Write Through or Normal, EBR output registers)	90	MHz
Distributed Memory Functions		
16x4 Pseudo-Dual Port RAM (one PFU)	214	MHz

1. The above timing numbers are generated using the Diamond design tool. Exact performance may vary with device and tool version. The tool uses internal parameters that have been characterized but are not tested on every device.

Derating Logic Timing

Logic timing provided in the following sections of the data sheet and the Lattice design tools are worst case numbers in the operating range. Actual delays may be much faster. Lattice design tools can provide logic timing numbers at a particular temperature and voltage.

sysCONFIG Port Timing Specifications

Symbol	Parameter		Min.	Max.	Units
All Configuration Modes					
t_{PRGM}	PROGRAMN low pulse accept		55	—	ns
t_{PRGMJ}	PROGRAMN low pulse rejection		—	25	ns
t_{INITL}	INITN low time	LCMXO2-256	—	30	µs
		LCMXO2-640	—	35	µs
		LCMXO2-640U/ LCMXO2-1200	—	55	µs
		LCMXO2-1200U/ LCMXO2-2000	—	70	µs
		LCMXO2-2000U/ LCMXO2-4000	—	105	µs
		LCMXO2-7000	—	130	µs
$t_{DPPINIT}$	PROGRAMN low to INITN low		—	150	ns
$t_{DPPDONE}$	PROGRAMN low to DONE low		—	150	ns
t_{IODISS}	PROGRAMN low to I/O disable		—	120	ns

Master SPI					
f_{MAX}	MCLK clock frequency		—	133	MHz
t_{MCLKH}	MCLK clock pulse width high		3.75	—	ns
t_{MCLKL}	MCLK clock pulse width low		3.75	—	ns
t_{STSU}	MCLK setup time		5	—	ns
t_{STH}	MCLK hold time		1	—	ns
t_{CSSPI}	INITN high to chip select low		100	200	ns
t_{MCLK}	INITN high to first MCLK edge		0.75	1	µs

Signal Descriptions

Signal Name	I/O	Descriptions
General Purpose		
P[Edge] [Row/Column Number]_[A/B/C/D]	I/O	[Edge] indicates the edge of the device on which the pad is located. Valid edge designations are L (Left), B (Bottom), R (Right), T (Top).
		[Row/Column Number] indicates the PFU row or the column of the device on which the PIO Group exists. When Edge is T (Top) or (Bottom), only need to specify Row Number. When Edge is L (Left) or R (Right), only need to specify Column Number.
		[A/B/C/D] indicates the PIO within the group to which the pad is connected.
		Some of these user-programmable pins are shared with special function pins. When not used as special function pins, these pins can be programmed as I/Os for user logic.
		During configuration of the user-programmable I/Os, the user has an option to tri-state the I/Os and enable an internal pull-up, pull-down or buskeeper resistor. This option also applies to unused pins (or those not bonded to a package pin). The default during configuration is for user-programmable I/Os to be tri-stated with an internal pull-down resistor enabled. When the device is erased, I/Os will be tri-stated with an internal pull-down resistor enabled. Some pins, such as PROGRAMN and JTAG pins, default to tri-stated I/Os with pull-up resistors enabled when the device is erased.
NC	—	No connect.
GND	—	GND – Ground. Dedicated pins. It is recommended that all GNDs are tied together. For QFN 48 package, the exposed die pad is the device ground.
VCC	—	V_{CC} – The power supply pins for core logic. Dedicated pins. It is recommended that all VCCs are tied to the same supply.
VCCIOx	—	VCCIO – The power supply pins for I/O Bank x. Dedicated pins. It is recommended that all VCCIOs located in the same bank are tied to the same supply.
PLL and Clock Functions (Used as user-programmable I/O pins when not used for PLL or clock pins)		
[LOC]_GPLL[T, C]_IN	—	Reference Clock (PLL) input pads: [LOC] indicates location. Valid designations are L (Left PLL) and R (Right PLL). T = true and C = complement.
[LOC]_GPLL[T, C]_FB	—	Optional Feedback (PLL) input pads: [LOC] indicates location. Valid designations are L (Left PLL) and R (Right PLL). T = true and C = complement.
PCLK [n]_[2:0]	—	Primary Clock pads. One to three clock pads per side.
Test and Programming (Dual function pins used for test access port and during sysCONFIG™)		
TMS	I	Test Mode Select input pin, used to control the 1149.1 state machine.
TCK	I	Test Clock input pin, used to clock the 1149.1 state machine.
TDI	I	Test Data input pin, used to load data into the device using an 1149.1 state machine.
TDO	O	Output pin – Test Data output pin used to shift data out of the device using 1149.1.
JTAGENB	I	Optionally controls behavior of TDI, TDO, TMS, TCK. If the device is configured to use the JTAG pins (TDI, TDO, TMS, TCK) as general purpose I/O, then:
		If JTAGENB is low: TDI, TDO, TMS and TCK can function a general purpose I/O.
		If JTAGENB is high: TDI, TDO, TMS and TCK function as JTAG pins.
		For more details, refer to TN1204, MachXO2 Programming and Configuration Usage Guide.
Configuration (Dual function pins used during sysCONFIG)		
PROGRAMN	I	Initiates configuration sequence when asserted low. During configuration, or when reserved as PROGRAMN in user mode, this pin always has an active pull-up.

Signal Descriptions (Cont.)

Signal Name	I/O	Descriptions
INITN	I/O	Open Drain pin. Indicates the FPGA is ready to be configured. During configuration, or when reserved as INITn in user mode, this pin has an active pull-up.
DONE	I/O	Open Drain pin. Indicates that the configuration sequence is complete, and the start-up sequence is in progress. During configuration, or when reserved as DONE in user mode, this pin has an active pull-up.
MCLK/CCLK	I/O	Input Configuration Clock for configuring an FPGA in Slave SPI mode. Output Configuration Clock for configuring an FPGA in SPI and SPIm configuration modes.
SN	I	Slave SPI active low chip select input.
CSSPIN	I/O	Master SPI active low chip select output.
SI/SPISI	I/O	Slave SPI serial data input and master SPI serial data output.
SO/SPISO	I/O	Slave SPI serial data output and master SPI serial data input.
SCL	I/O	Slave I^2C clock input and master I^2C clock output.
SDA	I/O	Slave I^2C data input and master I^2C data output.

Part Number	LUTs	Supply Voltage	Grade	Package	Leads	Temp.

Date	Version	Section	Change Summary
March 2017	3.3	DC and Switching Characteristics	Updated the Absolute Maximum Ratings section. Added standards.
			Updated the sysIO Recommended Operating Conditions section. Added standards.
			Updated the sysIO Single-Ended DC Electrical Characteristics section. Added standards.
			Updated the MachXO2 External Switching Characteristics – HC/HE Devices section. Under 7:1 LVDS Outputs – GDDR71_TX.ECLK.7:1, the D_{VB} and the D_{VA} parameters were changed to D_{IB} and D_{IA}. The parameter descriptions were also modified.
			Updated the MachXO2 External Switching Characteristics – ZE Devices section. Under 7:1 LVDS Outputs – GDDR71_TX.ECLK.7:1, the D_{VB} and the D_{VA} parameters were changed to D_{IB} and D_{IA}. The parameter descriptions were also modified.
			Updated the sysCONFIG Port Timing Specifications section. Corrected the t_{INITL} units from ns to μs.
		Pinout Information	Updated the Signal Descriptions section. Revised the descriptions of the PROGRAMN, INITN, and DONE signals.
			Updated the Pinout Information Summary section. Added footnote to MachXO2-1200 32 QFN.
		Ordering Information	Updated the MachXO2 Part Number Description section. Corrected the MG184, BG256, FTG256 package information. Added "(0.8 mm Pitch)" to BG332.
			Updated the Ultra Low Power Industrial Grade Devices, Halogen Free (RoHS) Packaging section. — Updated LCMXO2-1200ZE-1UWG25ITR50 footnote. — Corrected footnote numbering typo. — Added the LCMXO2-2000ZE-1UWG49ITR50 and LCMXO2-2000ZE-1UWG49ITR1K part numbers. Updated/added footnote/s.

Date	Version	Section	Change Summary
May 2014	2.5	Architecture	Updated TransFR (Transparent Field Reconfiguration) section. Updated TransFR description for PLL use during background Flash programming.
February 2014	02.4	Introduction	Included the 49 WLCSP package in the MachXO2 Family Selection Guide table.
		Architecture	Added information to Standby Mode and Power Saving Options section.
		Pinout Information	Added the XO2-2000 49 WLCSP in the Pinout Information Summary table.
		Ordering Information	Added UW49 package in MachXO2 Part Number Description.
			Added and LCMXO2-2000ZE-1UWG49CTR in Ultra Low Power Commercial Grade Devices, Halogen Free (RoHS) Packaging section.
			Added and LCMXO2-2000ZE-1UWG49ITR in Ultra Low Power Industrial Grade Devices, Halogen Free (RoHS) Packaging section.
December 2013	02.3	Architecture	Updated information on CLKOS output divider in sysCLOCK Phase Locked Loops (PLLs) section.
		DC and Switching Characteristics	Updated Static Supply Current – ZE Devices table.
			Updated footnote 4 in sysIO Single-Ended DC Electrical Characteristics table; Updated V_{IL} Max. (V) data for LVCMOS 25 and LVCMOS 28.
			Updated V_{OS} test condition in sysIO Differential Electrical Characteristics - LVDS table.
September 2013	02.2	Architecture	Removed I²C Clock-Stretching feature per PCN #10A-13.
			Removed information on PDPR memory in RAM Mode section.
			Updated Supported Input Standards table.
		DC and Switching Characteristics	Updated Power-On-Reset Voltage Levels table.
June 2013	02.1	Architecture	Architecture Overview – Added information on the state of the register on power up and after configuration.
			sysCLOCK Phase Locked Loops (PLLs) section – Added missing cross reference to sysCLOCK PLL Timing table.
		DC and Switching Characteristics	Added slew rate information to footnote 2 of the MachXO2 External Switching Characteristics – HC/HE Devices and the MachXO2 External Switching Characteristics – ZE Devices tables.
			Power-On-Reset Voltage Levels table – Added symbols.

Date	Version	Section	Change Summary
February 2012	01.7	All	Updated document with new corporate logo.
	01.6	—	Data sheet status changed from preliminary to final.
		Introduction	MachXO2 Family Selection Guide table – Removed references to 49-ball WLCSP.
		DC and Switching Characteristics	Updated Flash Download Time table.
			Modified Storage Temperature in the Absolute Maximum Ratings section.
			Updated I_{DK} max in Hot Socket Specifications table.
			Modified Static Supply Current tables for ZE and HC/HE devices.
			Updated Power Supply Ramp Rates table.
			Updated Programming and Erase Supply Current tables.
			Updated data in the External Switching Characteristics table.
			Corrected Absolute Maximum Ratings for Dedicated Input Voltage Applied for LCMXO2 HC.
			DC Electrical Characteristics table – Minor corrections to conditions for I_{IL}, I_{IH}.
		Pinout Information	Removed references to 49-ball WLCSP.
			Signal Descriptions table – Updated description for GND, VCC, and VCCIOx.
			Updated Pin Information Summary table – Number of VCCIOs, GNDs, VCCs, and Total Count of Bonded Pins for MachXO2-256, 640, and 640U and Dual Function I/O for MachXO2-4000 332caBGA.
		Ordering Information	Removed references to 49-ball WLCSP
August 2011	01.5	DC and Switching Characteristics	Updated ESD information.
		Ordering Information	Updated footnote for ordering WLCSP devices.
	01.4	Architecture	Updated information in Clock/Control Distribution Network and sys-CLOCK Phase Locked Loops (PLLs).
		DC and Switching Characteristics	Updated I_{IL} and I_{IH} conditions in the DC Electrical Characteristics table.
		Pinout Information	Included number of 7:1 and 8:1 gearboxes (input and output) in the pin information summary tables.
			Updated Pin Information Summary table: Dual Function I/O, DQS Groups Bank 1, Total General Purpose Single-Ended I/O, Differential I/O Per Bank, Total Count of Bonded Pins, Gearboxes.
			Added column of data for MachXO2-2000 49 WLCSP.
		Ordering Information	Updated R1 Device Specifications text section with information on migration from MachXO2-1200-R1 to Standard (non-R1) devices.
			Corrected Supply Voltage typo for part numbers: LCMX02-2000UHE-4FG484I, LCMX02-2000UHE-5FG484I, LCMX02-2000UHE-6FG484I.
			Added footnote for WLCSP package parts.
		Supplemental Information	Removed reference to Stand-alone Power Calculator for MachXO2 Devices. Added reference to AN8086, Designing for Migration from MachXO2-1200-R1 to Standard (non-R1) Devices.
