Welcome to E-XFL.COM

Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

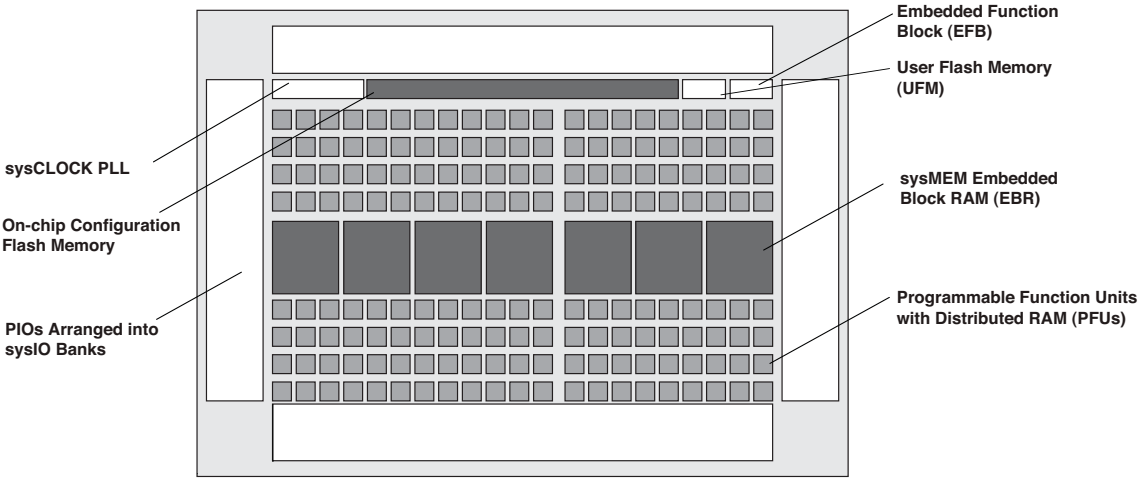
The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Details	
Product Status	Active
Number of LABs/CLBs	160
Number of Logic Elements/Cells	1280
Total RAM Bits	65536
Number of I/O	79
Number of Gates	-
Voltage - Supply	2.375V ~ 3.465V
Mounting Type	Surface Mount
Operating Temperature	-40°C ~ 100°C (TJ)
Package / Case	100-LQFP
Supplier Device Package	100-TQFP (14x14)
Purchase URL	https://www.e-xfl.com/product-detail/lattice-semiconductor/lcmxo2-1200hc-4tg100i

Architecture Overview

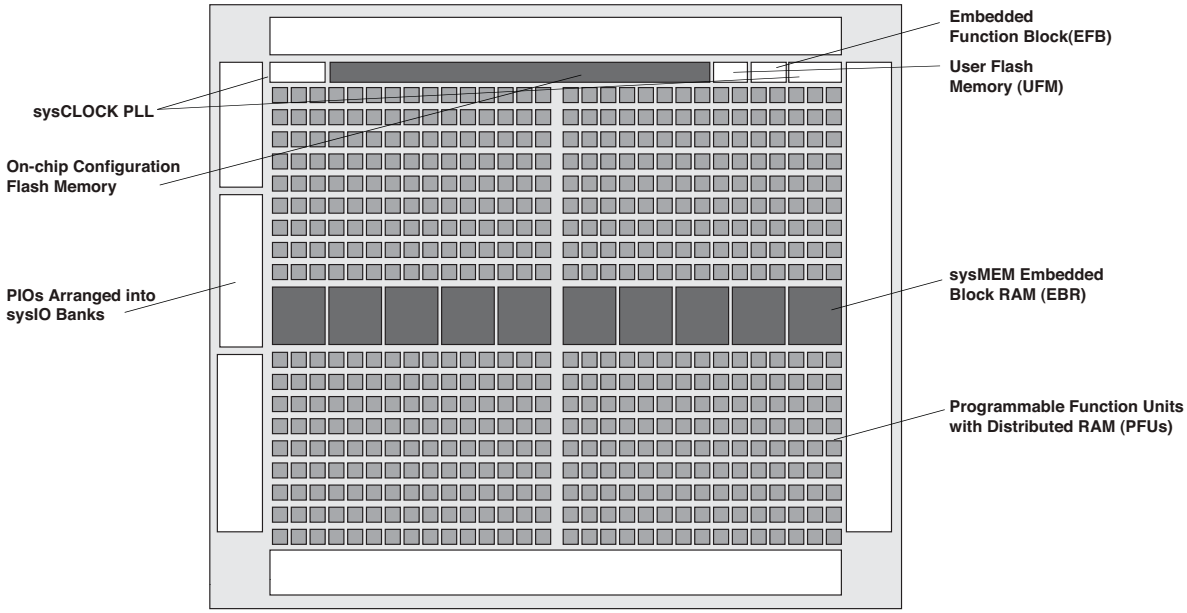
The MachXO2 family architecture contains an array of logic blocks surrounded by Programmable I/O (PIO). The larger logic density devices in this family have sysCLOCK™ PLLs and blocks of sysMEM Embedded Block RAM (EBRs). Figure 2-1 and Figure 2-2 show the block diagrams of the various family members.

Figure 2-1. Top View of the MachXO2-1200 Device



Note: MachXO2-256, and MachXO2-640/U are similar to MachXO2-1200. MachXO2-256 has a lower LUT count and no PLL or EBR blocks. MachXO2-640 has no PLL, a lower LUT count and two EBR blocks. MachXO2-640U has a lower LUT count, one PLL and seven EBR blocks.

Figure 2-2. Top View of the MachXO2-4000 Device



Note: MachXO2-1200U, MachXO2-2000/U and MachXO2-7000 are similar to MachXO2-4000. MachXO2-1200U and MachXO2-2000 have a lower LUT count, one PLL, and eight EBR blocks. MachXO2-2000U has a lower LUT count, two PLLs, and 10 EBR blocks. MachXO2-7000 has a higher LUT count, two PLLs, and 26 EBR blocks.

ROM Mode

ROM mode uses the LUT logic; hence, slices 0-3 can be used in ROM mode. Preloading is accomplished through the programming interface during PFU configuration.

For more information on the RAM and ROM modes, please refer to TN1201, Memory Usage Guide for MachXO2 Devices.

Routing

There are many resources provided in the MachXO2 devices to route signals individually or as buses with related control signals. The routing resources consist of switching circuitry, buffers and metal interconnect (routing) segments.

The inter-PFU connections are made with three different types of routing resources: x1 (spans two PFUs), x2 (spans three PFUs) and x6 (spans seven PFUs). The x1, x2, and x6 connections provide fast and efficient connections in the horizontal and vertical directions.

The design tools take the output of the synthesis tool and places and routes the design. Generally, the place and route tool is completely automatic, although an interactive routing editor is available to optimize the design.

Clock/Control Distribution Network

Each MachXO2 device has eight clock inputs (PCLK [T, C] [Banknum]_[2..0]) – three pins on the left side, two pins each on the bottom and top sides and one pin on the right side. These clock inputs drive the clock nets. These eight inputs can be differential or single-ended and may be used as general purpose I/O if they are not used to drive the clock nets. When using a single ended clock input, only the PCLKT input can drive the clock tree directly.

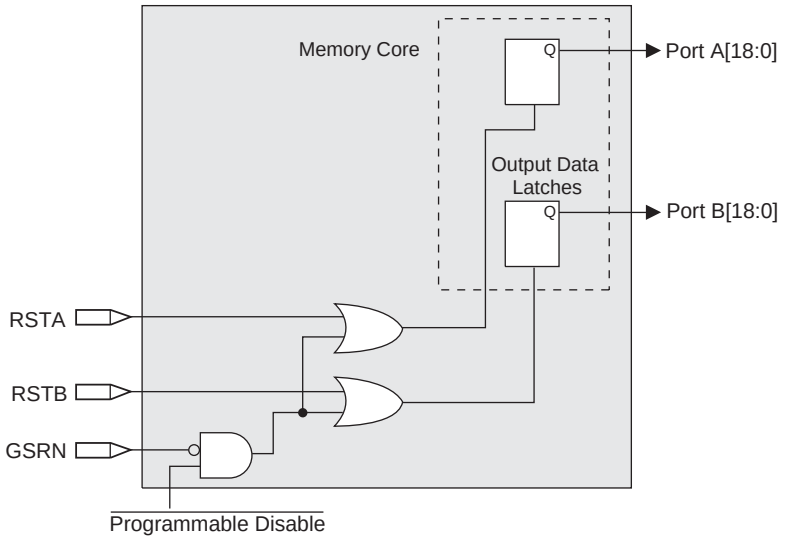
The MachXO2 architecture has three types of clocking resources: edge clocks, primary clocks and secondary high fanout nets. MachXO2-640U, MachXO2-1200/U and higher density devices have two edge clocks each on the top and bottom edges. Lower density devices have no edge clocks. Edge clocks are used to clock I/O registers and have low injection time and skew. Edge clock inputs are from PLL outputs, primary clock pads, edge clock bridge outputs and CIB sources.

The eight primary clock lines in the primary clock network drive throughout the entire device and can provide clocks for all resources within the device including PFUs, EBRs and PICs. In addition to the primary clock signals, MachXO2 devices also have eight secondary high fanout signals which can be used for global control signals, such as clock enables, synchronous or asynchronous clears, presets, output enables, etc. Internal logic can drive the global clock network for internally-generated global clocks and control signals.

The maximum frequency for the primary clock network is shown in the MachXO2 External Switching Characteristics table.

The primary clock signals for the MachXO2-256 and MachXO2-640 are generated from eight 17:1 muxes The available clock sources include eight I/O sources and 9 routing inputs. Primary clock signals for the MachXO2-640U, MachXO2-1200/U and larger devices are generated from eight 27:1 muxes The available clock sources include eight I/O sources, 11 routing inputs, eight clock divider inputs and up to eight sysCLOCK PLL outputs.

Figure 2-9. Memory Core Reset

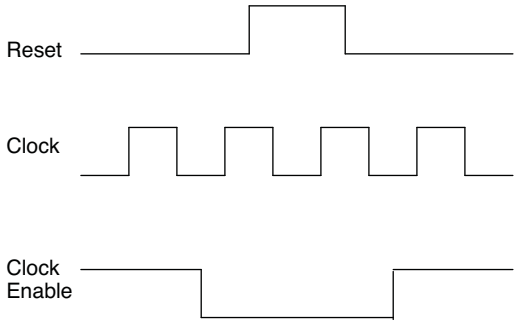


For further information on the sysMEM EBR block, please refer to TN1201, Memory Usage Guide for MachXO2 Devices.

EBR Asynchronous Reset

EBR asynchronous reset or GSR (if used) can only be applied if all clock enables are low for a clock cycle before the reset is applied and released a clock cycle after the reset is released, as shown in Figure 2-10. The GSR input to the EBR is always asynchronous.

Figure 2-10. EBR Asynchronous Reset (Including GSR) Timing Diagram



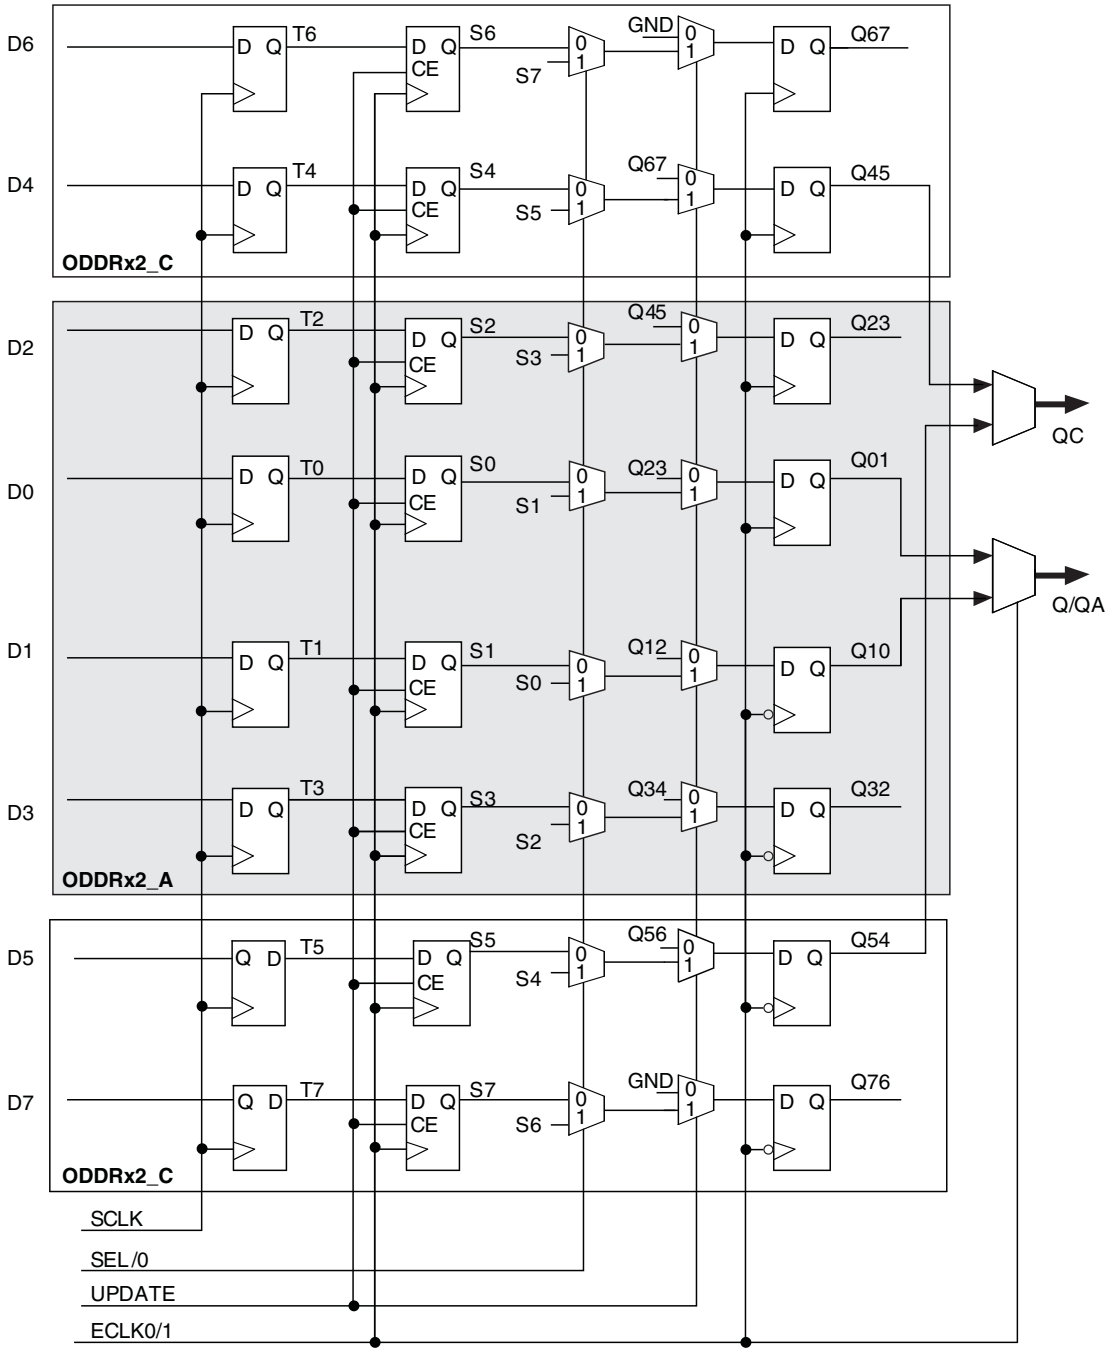
If all clock enables remain enabled, the EBR asynchronous reset or GSR may only be applied and released after the EBR read and write clock inputs are in a steady state condition for a minimum of $1/f_{MAX}$ (EBR clock). The reset release must adhere to the EBR synchronous reset setup time before the next active read or write clock edge.

If an EBR is pre-loaded during configuration, the GSR input must be disabled or the release of the GSR during device wake up must occur before the release of the device I/Os becoming active.

These instructions apply to all EBR RAM, ROM and FIFO implementations. For the EBR FIFO mode, the GSR signal is always enabled and the WE and RE signals act like the clock enable signals in Figure 2-10. The reset timing rules apply to the RPReset input versus the RE input and the RST input versus the WE and RE inputs. Both RST and RPReset are always asynchronous EBR inputs. For more details refer to TN1201, Memory Usage Guide for MachXO2 Devices.

Note that there are no reset restrictions if the EBR synchronous reset is used and the EBR GSR input is disabled.

Figure 2-17. Output Gearbox



More information on the output gearbox is available in TN1203, Implementing High-Speed Interfaces with MachXO2 Devices.

Table 2-13. Supported Output Standards

Output Standard	V_{CCIO} (Typ.)
Single-Ended Interfaces	
LVTTL	3.3
LVCMOS33	3.3
LVCMOS25	2.5
LVCMOS18	1.8
LVCMOS15	1.5
LVCMOS12	1.2
LVCMOS33, Open Drain	—
LVCMOS25, Open Drain	—
LVCMOS18, Open Drain	—
LVCMOS15, Open Drain	—
LVCMOS12, Open Drain	—
PCI33	3.3
SSTL25 (Class I)	2.5
SSTL18 (Class I)	1.8
HSTL18(Class I)	1.8
Differential Interfaces	
LVDS[1, 2]	2.5, 3.3
BLVDS, MLVDS, RSDS [2]	2.5
LVPECL[2]	3.3
MIPI[2]	2.5
Differential SSTL18	1.8
Differential SSTL25	2.5
Differential HSTL18	1.8

1. MachXO2-640U, MachXO2-1200/U and larger devices have dedicated LVDS buffers.
2. These interfaces can be emulated with external resistors in all devices.

sysIO Buffer Banks

The numbers of banks vary between the devices of this family. MachXO2-1200U, MachXO2-2000/U and higher density devices have six I/O banks (one bank on the top, right and bottom side and three banks on the left side). The MachXO2-1200 and lower density devices have four banks (one bank per side). Figures 2-18 and 2-19 show the sysIO banks and their associated supplies for all devices.

There are some limitations on the use of the hardened user SPI. These are defined in the following technical notes:

- TN1087, Minimizing System Interruption During Configuration Using TransFR Technology (Appendix B)
- TN1205, Using User Flash Memory and Hardened Control Functions in MachXO2 Devices

Figure 2-22. SPI Core Block Diagram

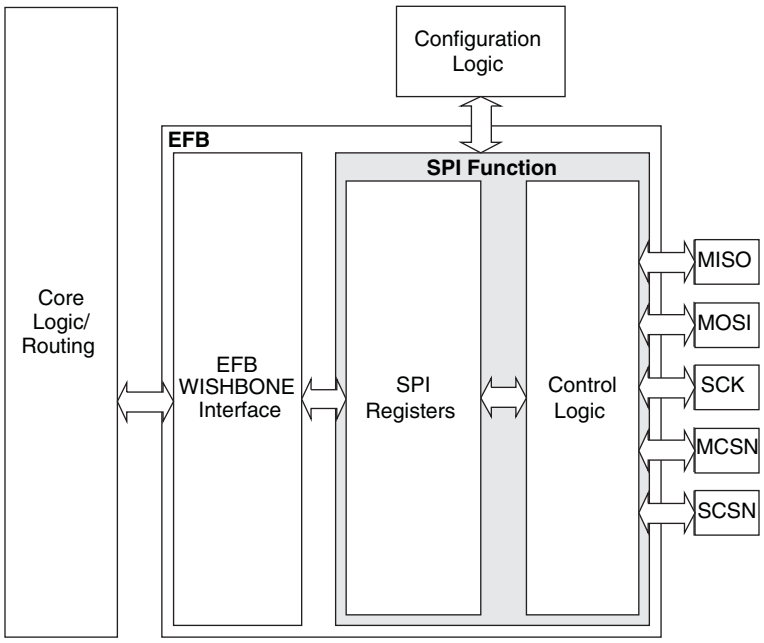


Table 2-16 describes the signals interfacing with the SPI cores.

Table 2-16. SPI Core Signal Description

Signal Name	I/O	Master/Slave	Description
spi_csn[0]	O	Master	SPI master chip-select output
spi_csn[1..7]	O	Master	Additional SPI chip-select outputs (total up to eight slaves)
spi_scsn	I	Slave	SPI slave chip-select input
spi_irq	O	Master/Slave	Interrupt request
spi_clk	I/O	Master/Slave	SPI clock. Output in master mode. Input in slave mode.
spi_miso	I/O	Master/Slave	SPI data. Input in master mode. Output in slave mode.
spi_mosi	I/O	Master/Slave	SPI data. Output in master mode. Input in slave mode.
ufm_sn	I	Slave	Configuration Slave Chip Select (active low), dedicated for selecting the User Flash Memory (UFM).
cfg_stdby	O	Master/Slave	Stand-by signal – To be connected only to the power module of the MachXO2 device. The signal is enabled only if the “Wakeup Enable” feature has been set within the EFB GUI, SPI Tab.
cfg_wake	O	Master/Slave	Wake-up signal – To be connected only to the power module of the MachXO2 device. The signal is enabled only if the “Wakeup Enable” feature has been set within the EFB GUI, SPI Tab.

Table 2-18. MachXO2 Power Saving Features Description

Device Subsystem	Feature Description
Bandgap	The bandgap can be turned off in standby mode. When the Bandgap is turned off, analog circuitry such as the POR, PLLs, on-chip oscillator, and referenced and differential I/O buffers are also turned off. Bandgap can only be turned off for 1.2 V devices.
Power-On-Reset (POR)	The POR can be turned off in standby mode. This monitors VCC levels. In the event of unsafe V_{CC} drops, this circuit reconfigures the device. When the POR circuitry is turned off, limited power detector circuitry is still active. This option is only recommended for applications in which the power supply rails are reliable.
On-Chip Oscillator	The on-chip oscillator has two power saving features. It may be switched off if it is not needed in your design. It can also be turned off in Standby mode.
PLL	Similar to the on-chip oscillator, the PLL also has two power saving features. It can be statically switched off if it is not needed in a design. It can also be turned off in Standby mode. The PLL will wait until all output clocks from the PLL are driven low before powering off.
I/O Bank Controller	Referenced and differential I/O buffers (used to implement standards such as HSTL, SSTL and LVDS) consume more than ratioed single-ended I/Os such as LVCMOS and LVTTL. The I/O bank controller allows the user to turn these I/Os off dynamically on a per bank selection.
Dynamic Clock Enable for Primary Clock Nets	Each primary clock net can be dynamically disabled to save power.
Power Guard	Power Guard is a feature implemented in input buffers. This feature allows users to switch off the input buffer when it is not needed. This feature can be used in both clock and data paths. Its biggest impact is that in the standby mode it can be used to switch off clock inputs that are distributed using general routing resources.

For more details on the standby mode refer to TN1198, Power Estimation and Management for MachXO2 Devices.

Power On Reset

MachXO2 devices have power-on reset circuitry to monitor V_{CCINT} and V_{CCIO} voltage levels during power-up and operation. At power-up, the POR circuitry monitors V_{CCINT} and V_{CCIO0} (controls configuration) voltage levels. It then triggers download from the on-chip configuration Flash memory after reaching the V_{PORUP} level specified in the Power-On-Reset Voltage table in the DC and Switching Characteristics section of this data sheet. For devices without voltage regulators (ZE and HE devices), V_{CCINT} is the same as the V_{CC} supply voltage. For devices with voltage regulators (HC devices), V_{CCINT} is regulated from the V_{CC} supply voltage. From this voltage reference, the time taken for configuration and entry into user mode is specified as Flash Download Time ($t_{REFRESH}$) in the DC and Switching Characteristics section of this data sheet. Before and during configuration, the I/Os are held in tri-state. I/Os are released to user functionality once the device has finished configuration. Note that for HC devices, a separate POR circuit monitors external V_{CC} voltage in addition to the POR circuit that monitors the internal post-regulated power supply voltage level.

Once the device enters into user mode, the POR circuitry can optionally continue to monitor V_{CCINT} levels. If V_{CCINT} drops below $V_{PORDNBG}$ level (with the bandgap circuitry switched on) or below $V_{PORDNSRAM}$ level (with the bandgap circuitry switched off to conserve power) device functionality cannot be guaranteed. In such a situation the POR issues a reset and begins monitoring the V_{CCINT} and V_{CCIO} voltage levels. $V_{PORDNBG}$ and $V_{PORDNSRAM}$ are both specified in the Power-On-Reset Voltage table in the DC and Switching Characteristics section of this data sheet.

Note that once a ZE or HE device enters user mode, users can switch off the bandgap to conserve power. When the bandgap circuitry is switched off, the POR circuitry also shuts down. The device is designed such that a minimal, low power POR circuit is still operational (this corresponds to the $V_{PORDNSRAM}$ reset point described in the paragraph above). However this circuit is not as accurate as the one that operates when the bandgap is switched on. The low power POR circuit emulates an SRAM cell and is biased to trip before the vast majority of SRAM cells flip. If users are concerned about the V_{CC} supply dropping below V_{CC} (min) they should not shut down the bandgap or POR circuit.

Power-On-Reset Voltage Levels[1, 2, 3, 4, 5]

Symbol	Parameter	Min.	Typ.	Max.	Units
V_{PORUP}	Power-On-Reset ramp up trip point (band gap based circuit monitoring V_{CCINT} and V_{CCIO0})	0.9	—	1.06	V
$V_{PORUPEXT}$	Power-On-Reset ramp up trip point (band gap based circuit monitoring external V_{CC} power supply)	1.5	—	2.1	V
$V_{PORDNBG}$	Power-On-Reset ramp down trip point (band gap based circuit monitoring V_{CCINT})	0.75	—	0.93	V
$V_{PORDNBGEXT}$	Power-On-Reset ramp down trip point (band gap based circuit monitoring V_{CC})	0.98	—	1.33	V
$V_{PORDNSRAM}$	Power-On-Reset ramp down trip point (SRAM based circuit monitoring V_{CCINT})	—	0.6	—	V
$V_{PORDNSRAMEXT}$	Power-On-Reset ramp down trip point (SRAM based circuit monitoring V_{CC})	—	0.96	—	V

1. These POR trip points are only provided for guidance. Device operation is only characterized for power supply voltages specified under recommended operating conditions.
2. For devices without voltage regulators V_{CCINT} is the same as the V_{CC} supply voltage. For devices with voltage regulators, V_{CCINT} is regulated from the V_{CC} supply voltage.
3. Note that V_{PORUP} (min.) and $V_{PORDNBG}$ (max.) are in different process corners. For any given process corner $V_{PORDNBG}$ (max.) is always 12.0 mV below V_{PORUP} (min.).
4. $V_{PORUPEXT}$ is for HC devices only. In these devices a separate POR circuit monitors the external V_{CC} power supply.
5. V_{CCIO0} does not have a Power-On-Reset ramp down trip point. V_{CCIO0} must remain within the Recommended Operating Conditions to ensure proper operation.

Programming/Erase Specifications

Symbol	Parameter	Min.	Max.[1]	Units
$N_{PROGCYC}$	Flash Programming cycles per $t_{RETENTION}$	—	10,000	Cycles
	Flash functional programming cycles	—	100,000	
$t_{RETENTION}$	Data retention at 100 °C junction temperature	10	—	Years
	Data retention at 85 °C junction temperature	20	—	

1. Maximum Flash memory reads are limited to 7.5E13 cycles over the lifetime of the product.

Hot Socketing Specifications[1, 2, 3]

Symbol	Parameter	Condition	Max.	Units
I_{DK}	Input or I/O leakage Current	$0 < V_{IN} < V_{IH}$ (MAX)	+/–1000	µA

1. Insensitive to sequence of V_{CC} and V_{CCIO}. However, assumes monotonic rise/fall rates for V_{CC} and V_{CCIO}.
2. $0 < V_{CC} < V_{CC}$ (MAX), $0 < V_{CCIO} < V_{CCIO}$ (MAX).
3. I_{DK} is additive to I_{PU}, I_{PD} or I_{BH}.

ESD Performance

Please refer to the MachXO2 Product Family Qualification Summary for complete qualification data, including ESD performance.

Static Supply Current – ZE Devices[1, 2, 3, 6]

Symbol	Parameter	Device	Typ.[4]	Units
I_{CC}	Core Power Supply	LCMXO2-256ZE	18	µA
		LCMXO2-640ZE	28	µA
		LCMXO2-1200ZE	56	µA
		LCMXO2-2000ZE	80	µA
		LCMXO2-4000ZE	124	µA
		LCMXO2-7000ZE	189	µA
I_{CCIO}	Bank Power Supply[5] V_{CCIO} = 2.5 V	All devices	1	µA

1. For further information on supply current, please refer to TN1198, Power Estimation and Management for MachXO2 Devices.
2. Assumes blank pattern with the following characteristics: all outputs are tri-stated, all inputs are configured as LVCMOS and held at V_{CCIO} or GND, on-chip oscillator is off, on-chip PLL is off. To estimate the impact of turning each of these items on, please refer to the following table or for more detail with your specific design use the Power Calculator tool.
3. Frequency = 0 MHz.
4. T_J = 25 °C, power supplies at nominal voltage.
5. Does not include pull-up/pull-down.
6. To determine the MachXO2 peak start-up current data, use the Power Calculator tool.

Static Power Consumption Contribution of Different Components – ZE Devices

The table below can be used for approximating static power consumption. For a more accurate power analysis for your design please use the Power Calculator tool.

Symbol	Parameter	Typ.	Units
I_{DCBG}	Bandgap DC power contribution	101	µA
I_{DCPOR}	POR DC power contribution	38	µA
$I_{DCIOBANKCONTROLLER}$	DC power contribution per I/O bank controller	143	µA

Input/Output Standard	V_{IL}		V_{IH}		V_{OL} Max. (V)	V_{OH} Min. (V)	I_{OL} Max.[4] (mA)	I_{OH} Max.[4] (mA)
	Min. (V)[3]	Max. (V)	Min. (V)	Max. (V)				
LVCMOS10R25	–0.3	V_{REF} – 0.1	V_{REF} + 0.1	3.6	0.40	NA Open Drain	16, 12, 8, 4	NA Open Drain

1. MachXO2 devices allow LVCMOS inputs to be placed in I/O banks where V_{CCIO} is different from what is specified in the applicable JEDEC specification. This is referred to as a ratioed input buffer. In a majority of cases this operation follows or exceeds the applicable JEDEC specification. The cases where MachXO2 devices do not meet the relevant JEDEC specification are documented in the table below.
2. MachXO2 devices allow for LVCMOS referenced I/Os which follow applicable JEDEC specifications. For more details about mixed mode operation please refer to please refer to TN1202, MachXO2 sysIO Usage Guide.
3. The dual function I^2C pins SCL and SDA are limited to a V_{IL} min of –0.25 V or to –0.3 V with a duration of <10 ns.
4. For electromigration, the average DC current sourced or sinked by I/O pads between two consecutive VCCIO or GND pad connections, or between the last VCCIO or GND in an I/O bank and the end of an I/O bank, as shown in the Logic Signal Connections table (also shown as I/O grouping) shall not exceed a maximum of n * 8 mA. “n” is the number of I/O pads between the two consecutive bank VCCIO or GND connections or between the last VCCIO and GND in a bank and the end of a bank. IO Grouping can be found in the Data Sheet Pin Tables, which can also be generated from the Lattice Diamond software.

Input Standard	V_{CCIO} (V)	V_{IL} Max. (V)
LVCMOS 33	1.5	0.685
LVCMOS 25	1.5	0.687
LVCMOS 18	1.5	0.655

sysIO Differential Electrical Characteristics

The LVDS differential output buffers are available on the top side of MachXO2-640U, MachXO2-1200/U and higher density devices in the MachXO2 PLD family.

1. Exact performance may vary with device and design implementation. Commercial timing numbers are shown at 85 °C and 1.14 V. Other operating conditions, including industrial, can be extracted from the Diamond software.
2. General I/O timing numbers based on LVCMOS 2.5, 8 mA, 0pf load, fast slew rate.
3. Generic DDR timing numbers based on LVDS I/O (for input, output, and clock ports).
4. DDR timing numbers based on SSTL25. DDR2 timing numbers based on SSTL18. LPDDR timing numbers based in LVCMOS18.
5. 7:1 LVDS (GDDR71) uses the LVDS I/O standard (for input, output, and clock ports).
6. For Generic DDRX1 mode $t_{SU} = t_{HO} = (t_{DVE} - t_{DVA} - 0.03\ ns)/2$.
7. The t_{SU_DEL} and t_{H_DEL} values use the SCLK_ZERHOLD default step size. Each step is 105 ps (–6), 113 ps (–5), 120 ps (–4).
8. This number for general purpose usage. Duty cycle tolerance is +/– 10%.
9. Duty cycle is +/–5% for system usage.
10. The above timing numbers are generated using the Diamond design tool. Exact performance may vary with the device selected.
11. High-speed DDR and LVDS not supported in SG32 (32 QFN) packages.
12. Advance information for MachXO2 devices in 48 QFN packages.
13. DDR memory interface not supported in QN84 (84 QFN) and SG32 (32 QFN) packages.

1. Lattice recommends soldering the central thermal pad onto the top PCB ground for improved thermal resistance.
2. For 48 QFN package, exposed die pad is the device ground.
3. 48-pin QFN information is 'Advanced'.

1. This part number has a tape and reel quantity of 5,000 units with a minimum order quantity of 10,000 units. Order quantities must be in increments of 5,000 units. For example, a 10,000 unit order will be shipped in two reels with one reel containing 5,000 units and the other reel with less than 5,000 units (depending on test yields). Unserviced backlog will be canceled.
2. This part number has a tape and reel quantity of 1,000 units with a minimum order quantity of 1,000. Order quantities must be in increments of 1,000 units. For example, a 5,000 unit order will be shipped as 5 reels of 1000 units each.
3. This part number has a tape and reel quantity of 50 units with a minimum order quantity of 50. Order quantities must be in increments of 50 units. For example, a 1,000 unit order will be shipped as 20 reels of 50 units each.

LCMXO2-2000HE-6FTG256I	2112	1.2 V	–6	Halogen-Free ftBGA	256	IND

Part Number	LUTs	Supply Voltage	Grade	Package	Leads	Temp.
LCMXO2-2000UHE-4FG484I	2112	1.2 V	–4	Halogen-Free fpBGA	484	IND
LCMXO2-2000UHE-5FG484I	2112	1.2 V	–5	Halogen-Free fpBGA	484	IND
LCMXO2-2000UHE-6FG484I	2112	1.2 V	–6	Halogen-Free fpBGA	484	IND

Date	Version	Section	Change Summary
January 2013	02.0	Introduction	Updated the total number IOs to include JTAGENB.
		Architecture	Supported Output Standards table – Added 3.3 V_{CCIO} (Typ.) to LVDS row.
			Changed SRAM CRC Error Detection to Soft Error Detection.
		DC and Switching Characteristics	Power Supply Ramp Rates table – Updated Units column for t_{RAMP} symbol.
			Added new Maximum sysIO Buffer Performance table.
			sysCLOCK PLL Timing table – Updated Min. column values for f_{IN}, f_{OUT}, f_{OUT2} and f_{PFD} parameters. Added t_{SPO} parameter. Updated footnote 6.
			MachXO2 Oscillator Output Frequency table – Updated symbol name for $t_{STABLEOSC.}$
			DC Electrical Characteristics table – Updated conditions for $I_{IL,}$ I_{IH} symbols.
			Corrected parameters tDQVBS and tDQVAS
			Corrected MachXO2 ZE parameters tDVADQ and tDVEDQ
		Pinout Information	Included the MachXO2-4000HE 184 csBGA package.
		Ordering Information	Updated part number.
April 2012	01.9	Architecture	Removed references to TN1200.
		Ordering Information	Updated the Device Status portion of the MachXO2 Part Number Description to include the 50 parts per reel for the WLCSP package.
			Added new part number and footnote 2 for LCMXO2-1200ZE-1UWG25ITR50.
			Updated footnote 1 for LCMXO2-1200ZE-1UWG25ITR.
		Supplemental Information	Removed references to TN1200.
March 2012	01.8	Introduction	Added 32 QFN packaging information to Features bullets and MachXO2 Family Selection Guide table.
		DC and Switching Characteristics	Changed ‘STANDBY’ to ‘USERSTDBY’ in Standby Mode timing diagram.
		Pinout Information	Removed footnote from Pin Information Summary tables.
			Added 32 QFN package to Pin Information Summary table.
		Ordering Information	Updated Part Number Description and Ordering Information tables for 32 QFN package.
			Updated topside mark diagram in the Ordering Information section.
