### Understanding **Embedded - FPGAs (Field Programmable Gate Array)**

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

### **Applications of Embedded - FPGAs**

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

#### **Details**

Product Status	Active
Number of LABs/CLBs	160
Number of Logic Elements/Cells	1280
Total RAM Bits	65536
Number of I/O	104
Number of Gates	-
Voltage - Supply	1.14V ~ 1.26V
Mounting Type	Surface Mount
Operating Temperature	-40°C ~ 100°C (TJ)
Package / Case	132-LFBGA, CSPBGA
Supplier Device Package	132-CSPBGA (8x8)
Purchase URL	<a href="https://www.e-xfl.com/product-detail/lattice-semiconductor/lcmxo2-1200ze-1mg132i">https://www.e-xfl.com/product-detail/lattice-semiconductor/lcmxo2-1200ze-1mg132i</a>

## Introduction

The MachXO2 family of ultra low power, instant-on, non-volatile PLDs has six devices with densities ranging from 256 to 6864 Look-Up Tables (LUTs). In addition to LUT-based, low-cost programmable logic these devices feature Embedded Block RAM (EBR), Distributed RAM, User Flash Memory (UFM), Phase Locked Loops (PLLs), pre-engineered source synchronous I/O support, advanced configuration support including dual-boot capability and hardened versions of commonly used functions such as SPI controller, I<sup>2</sup>C controller and timer/counter. These features allow these devices to be used in low cost, high volume consumer and system applications.

The MachXO2 devices are designed on a 65 nm non-volatile low power process. The device architecture has several features such as programmable low swing differential I/Os and the ability to turn off I/O banks, on-chip PLLs and oscillators dynamically. These features help manage static and dynamic power consumption resulting in low static power for all members of the family.

The MachXO2 devices are available in two versions – ultra low power (ZE) and high performance (HC and HE) devices. The ultra low power devices are offered in three speed grades –1, –2 and –3, with –3 being the fastest. Similarly, the high-performance devices are offered in three speed grades: –4, –5 and –6, with –6 being the fastest. HC devices have an internal linear voltage regulator which supports external V<sub>CC</sub> supply voltages of 3.3 V or 2.5 V. ZE and HE devices only accept 1.2 V as the external V<sub>CC</sub> supply voltage. With the exception of power supply voltage all three types of devices (ZE, HC and HE) are functionally compatible and pin compatible with each other.

The MachXO2 PLDs are available in a broad range of advanced halogen-free packages ranging from the space saving 2.5 mm x 2.5 mm WLCSP to the 23 mm x 23 mm fpBGA. MachXO2 devices support density migration within the same package. Table 1-1 shows the LUT densities, package and I/O options, along with other key parameters.

The pre-engineered source synchronous logic implemented in the MachXO2 device family supports a broad range of interface standards, including LPDDR, DDR, DDR2 and 7:1 gearing for display I/Os.

The MachXO2 devices offer enhanced I/O features such as drive strength control, slew rate control, PCI compatibility, bus-keeper latches, pull-up resistors, pull-down resistors, open drain outputs and hot socketing. Pull-up, pull-down and bus-keeper features are controllable on a “per-pin” basis.

A user-programmable internal oscillator is included in MachXO2 devices. The clock output from this oscillator may be divided by the timer/counter for use as clock input in functions such as LED control, key-board scanner and similar state machines.

The MachXO2 devices also provide flexible, reliable and secure configuration from on-chip Flash memory. These devices can also configure themselves from external SPI Flash or be configured by an external master through the JTAG test access port or through the I<sup>2</sup>C port. Additionally, MachXO2 devices support dual-boot capability (using external Flash memory) and remote field upgrade (TransFR) capability.

Lattice provides a variety of design tools that allow complex designs to be efficiently implemented using the MachXO2 family of devices. Popular logic synthesis tools provide synthesis library support for MachXO2. Lattice design tools use the synthesis tool output along with the user-specified preferences and constraints to place and route the design in the MachXO2 device. These tools extract the timing from the routing and back-annotate it into the design for timing verification.

Lattice provides many pre-engineered IP (Intellectual Property) LatticeCORE™ modules, including a number of reference designs licensed free of charge, optimized for the MachXO2 PLD family. By using these configurable soft core IP cores as standardized blocks, users are free to concentrate on the unique aspects of their design, increasing their productivity.

Data Sheet DS1035

### Architecture Overview

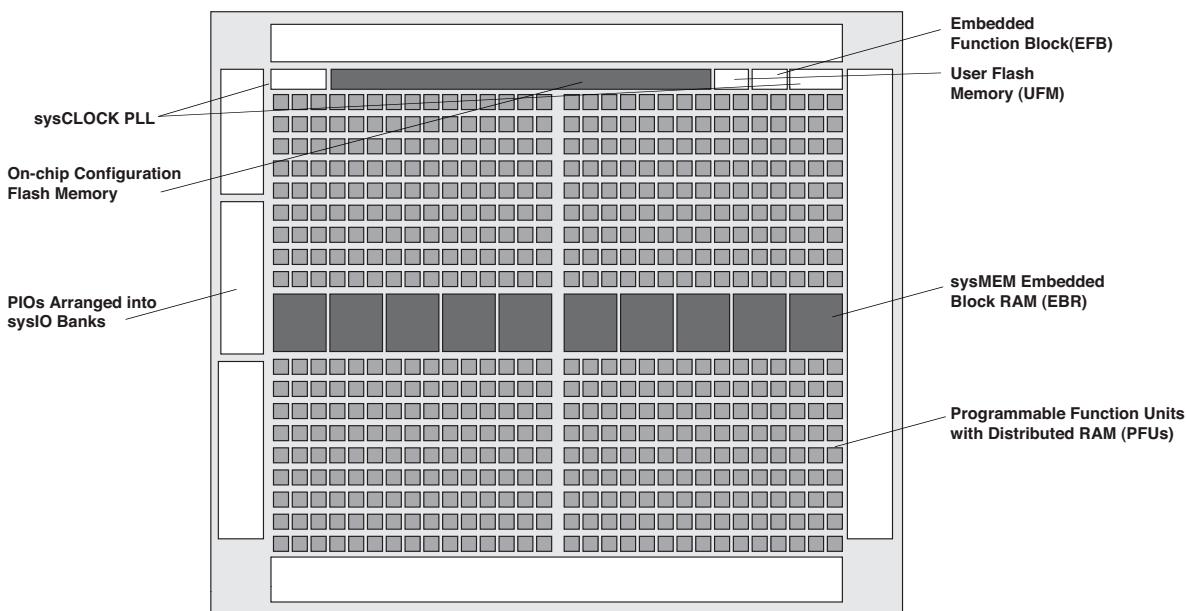

The MachXO2 family architecture contains an array of logic blocks surrounded by Programmable I/O (PIO). The larger logic density devices in this family have sysCLOCK™ PLLs and blocks of sysMEM Embedded Block RAM (EBRs). Figure 2-1 and Figure 2-2 show the block diagrams of the various family members.

**Figure 2-1. Top View of the MachXO2-1200 Device**

Note: MachXO2-256, and MachXO2-640/U are similar to MachXO2-1200. MachXO2-256 has a lower LUT count and no PLL or EBR blocks. MachXO2-640 has no PLL, a lower LUT count and two EBR blocks. MachXO2-640U has a lower LUT count, one PLL and seven EBR blocks.

**Figure 2-2. Top View of the MachXO2-4000 Device**

Note: MachXO2-1200U, MachXO2-2000/U and MachXO2-7000 are similar to MachXO2-4000. MachXO2-1200U and MachXO2-2000 have a lower LUT count, one PLL, and eight EBR blocks. MachXO2-2000U has a lower LUT count, two PLLs, and 10 EBR blocks. MachXO2-7000 has a higher LUT count, two PLLs, and 26 EBR blocks.

MachXO2-640U, MachXO2-1200/U, MachXO2-2000/U, MachXO2-4000 and MachXO2-7000 devices contain three types of sysIO buffer pairs.

### 1. Left and Right sysIO Buffer Pairs

The sysIO buffer pairs in the left and right banks of the device consist of two single-ended output drivers and two single-ended input buffers (for ratioed inputs such as LVC MOS and LV TTL). The I/O pairs on the left and right of the devices also have differential and referenced input buffers.

### 2. Bottom sysIO Buffer Pairs

The sysIO buffer pairs in the bottom bank of the device consist of two single-ended output drivers and two single-ended input buffers (for ratioed inputs such as LVC MOS and LV TTL). The I/O pairs on the bottom also have differential and referenced input buffers. Only the I/Os on the bottom banks have programmable PCI clamps and differential input termination. The PCI clamp is enabled after  $V_{CC}$  and  $V_{CCIO}$  are at valid operating levels and the device has been configured.

### 3. Top sysIO Buffer Pairs

The sysIO buffer pairs in the top bank of the device consist of two single-ended output drivers and two single-ended input buffers (for ratioed inputs such as LVC MOS and LV TTL). The I/O pairs on the top also have differential and referenced I/O buffers. Half of the sysIO buffer pairs on the top edge have true differential outputs. The sysIO buffer pair comprising of the A and B PIOs in every PIC on the top edge have a differential output driver. The referenced input buffer can also be configured as a differential input buffer.

## Typical I/O Behavior During Power-up

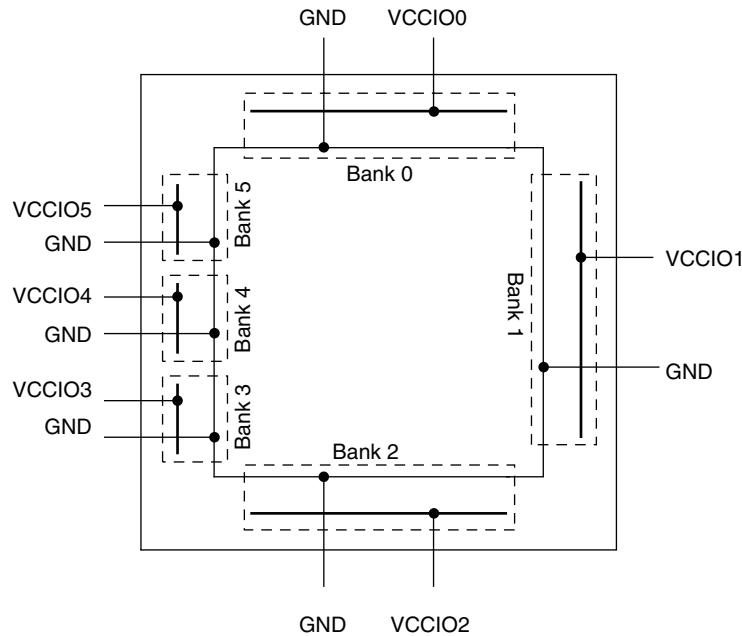

The internal power-on-reset (POR) signal is deactivated when  $V_{CC}$  and  $V_{CCIO}$  have reached  $V_{PORUP}$  level defined in the Power-On-Reset Voltage table in the DC and Switching Characteristics section of this data sheet. After the POR signal is deactivated, the FPGA core logic becomes active. It is the user's responsibility to ensure that all  $V_{CCIO}$  banks are active with valid input logic levels to properly control the output logic states of all the I/O banks that are critical to the application. The default configuration of the I/O pins in a blank device is tri-state with a weak pull-down to GND (some pins such as PROGRAMN and the JTAG pins have weak pull-up to  $V_{CCIO}$  as the default functionality). The I/O pins will maintain the blank configuration until  $V_{CC}$  and  $V_{CCIO}$  (for I/O banks containing configuration I/Os) have reached  $V_{PORUP}$  levels at which time the I/Os will take on the user-configured settings only after a proper download/configuration.

## Supported Standards

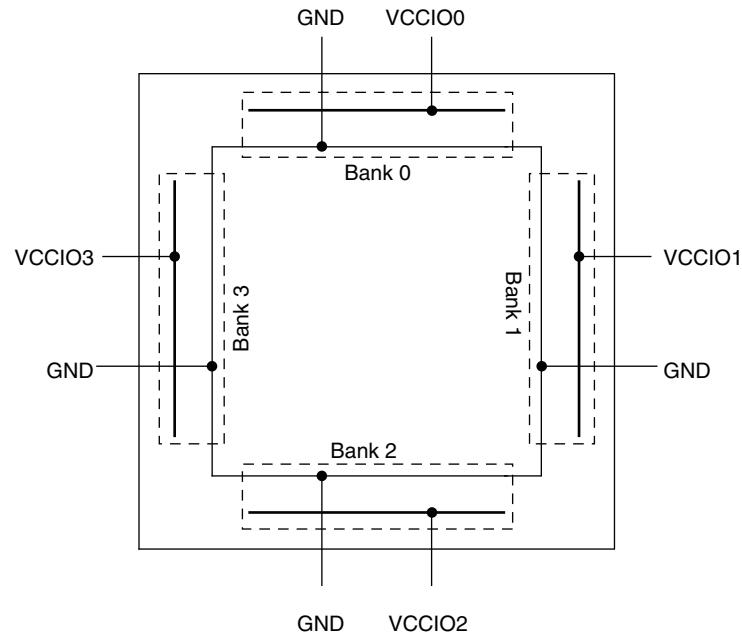

The MachXO2 sysIO buffer supports both single-ended and differential standards. Single-ended standards can be further subdivided into LVC MOS, LV TTL, and PCI. The buffer supports the LV TTL, PCI, LVC MOS 1.2, 1.5, 1.8, 2.5, and 3.3 V standards. In the LVC MOS and LV TTL modes, the buffer has individually configurable options for drive strength, bus maintenance (weak pull-up, weak pull-down, bus-keeper latch or none) and open drain. BLVDS, MLVDS and LVPECL output emulation is supported on all devices. The MachXO2-640U, MachXO2-1200/U and higher devices support on-chip LVDS output buffers on approximately 50% of the I/Os on the top bank. Differential receivers for LVDS, BLVDS, MLVDS and LVPECL are supported on all banks of MachXO2 devices. PCI support is provided in the bottom bank of the MachXO2-640U, MachXO2-1200/U and higher density devices. Table 2-11 summarizes the I/O characteristics of the MachXO2 PLDs.

Tables 2-11 and 2-12 show the I/O standards (together with their supply and reference voltages) supported by the MachXO2 devices. For further information on utilizing the sysIO buffer to support a variety of standards please see TN1202, [MachXO2 sysIO Usage Guide](#).

**Figure 2-18. MachXO2-1200U, MachXO2-2000/U, MachXO2-4000 and MachXO2-7000 Banks**

**Figure 2-19. MachXO2-256, MachXO2-640/U and MachXO2-1200 Banks**

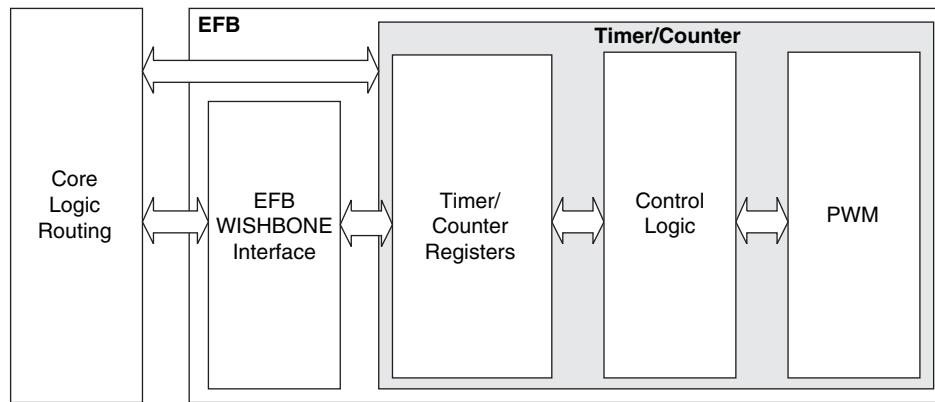

## Hardened Timer/Counter

MachXO2 devices provide a hard Timer/Counter IP core. This Timer/Counter is a general purpose, bi-directional, 16-bit timer/counter module with independent output compare units and PWM support. The Timer/Counter supports the following functions:

- Supports the following modes of operation:
  - Watchdog timer
  - Clear timer on compare match
  - Fast PWM
  - Phase and Frequency Correct PWM
- Programmable clock input source
- Programmable input clock prescaler
- One static interrupt output to routing
- One wake-up interrupt to on-chip standby mode controller.
- Three independent interrupt sources: overflow, output compare match, and input capture
- Auto reload
- Time-stamping support on the input capture unit
- Waveform generation on the output
- Glitch-free PWM waveform generation with variable PWM period
- Internal WISHBONE bus access to the control and status registers
- Stand-alone mode with preloaded control registers and direct reset input

**Figure 2-23. Timer/Counter Block Diagram**

**Table 2-17. Timer/Counter Signal Description**

Port	I/O	Description
tc_clk	I	Timer/Counter input clock signal
tc_rstn	I	Register tc_rstn_ena is preloaded by configuration to always keep this pin enabled
tc_ic	I	Input capture trigger event, applicable for non-pwm modes with WISHBONE interface. If enabled, a rising edge of this signal will be detected and synchronized to capture tc_cnt value into tc_icr for time-stamping.
tc_int	O	Without WISHBONE – Can be used as overflow flag With WISHBONE – Controlled by three IRQ registers
tc_oc	O	Timer counter output signal

## DC and Switching Characteristics

March 2017

Data Sheet DS1035

### Absolute Maximum Ratings<sup>1, 2, 3</sup>

	MachXO2 ZE/HE (1.2 V)	MachXO2 HC (2.5 V / 3.3 V)
Supply Voltage $V_{CC}$ .....	-0.5 V to 1.32 V .....	-0.5 V to 3.75 V .....
Output Supply Voltage $V_{CCIO}$ .....	-0.5 V to 3.75 V .....	-0.5 V to 3.75 V .....
I/O Tri-state Voltage Applied <sup>4, 5</sup> .....	-0.5 V to 3.75 V .....	-0.5 V to 3.75 V .....
Dedicated Input Voltage Applied <sup>4</sup> .....	-0.5 V to 3.75 V .....	-0.5 V to 3.75 V .....
Storage Temperature (Ambient) .....	-55 °C to 125 °C .....	-55 °C to 125 °C .....
Junction Temperature ( $T_J$ ) .....	-40 °C to 125 °C .....	-40 °C to 125 °C .....

1. Stress above those listed under the "Absolute Maximum Ratings" may cause permanent damage to the device. Functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied.
2. Compliance with the Lattice [Thermal Management](#) document is required.
3. All voltages referenced to GND.
4. Overshoot and undershoot of -2 V to ( $V_{IHMAX} + 2$ ) volts is permitted for a duration of <20 ns.
5. The dual function I<sup>2</sup>C pins SCL and SDA are limited to -0.25 V to 3.75 V or to -0.3 V with a duration of <20 ns.

### Recommended Operating Conditions<sup>1</sup>

Symbol	Parameter	Min.	Max.	Units
$V_{CC}$ <sup>1</sup>	Core Supply Voltage for 1.2 V Devices	1.14	1.26	V
	Core Supply Voltage for 2.5 V / 3.3 V Devices	2.375	3.6	V
$V_{CCIO}$ <sup>1, 2, 3</sup>	I/O Driver Supply Voltage	1.14	3.6	V
$t_{JCOM}$	Junction Temperature Commercial Operation	0	85	°C
$t_{JIND}$	Junction Temperature Industrial Operation	-40	100	°C

1. Like power supplies must be tied together. For example, if  $V_{CCIO}$  and  $V_{CC}$  are both the same voltage, they must also be the same supply.
2. See recommended voltages by I/O standard in subsequent table.
3.  $V_{CCIO}$  pins of unused I/O banks should be connected to the  $V_{CC}$  power supply on boards.

### Power Supply Ramp Rates<sup>1</sup>

Symbol	Parameter	Min.	Typ.	Max.	Units
$t_{RAMP}$	Power supply ramp rates for all power supplies.	0.01	—	100	V/ms

1. Assumes monotonic ramp rates.

## Programming and Erase Flash Supply Current – ZE Devices<sup>1, 2, 3, 4</sup>

Symbol	Parameter	Device	Typ. <sup>5</sup>	Units
I <sub>CC</sub>	Core Power Supply	LCMXO2-256ZE	13	mA
		LCMXO2-640ZE	14	mA
		LCMXO2-1200ZE	15	mA
		LCMXO2-2000ZE	17	mA
		LCMXO2-4000ZE	18	mA
		LCMXO2-7000ZE	20	mA
I <sub>CCIO</sub>	Bank Power Supply <sup>6</sup>	All devices	0	mA

1. For further information on supply current, please refer to TN1198, [Power Estimation and Management for MachXO2 Devices](#).

2. Assumes all inputs are held at V<sub>CCIO</sub> or GND and all outputs are tri-stated.

3. Typical user pattern.

4. JTAG programming is at 25 MHz.

5. TJ = 25 °C, power supplies at nominal voltage.

6. Per bank. V<sub>CCIO</sub> = 2.5 V. Does not include pull-up/pull-down.

## sysIO Recommended Operating Conditions

## R1 Device Specifications

The LCMXO2-1200ZE/HC “R1” devices have the same specifications as their Standard (non-R1) counterparts except as listed below. For more details on the R1 to Standard migration refer to AN8086, [Designing for Migration from MachXO2-1200-R1 to Standard Non-R1 Devices](#).

- The User Flash Memory (UFM) cannot be programmed through the internal WISHBONE interface. It can still be programmed through the JTAG/SPI/I<sup>2</sup>C ports.
- The on-chip differential input termination resistor value is higher than intended. It is approximately 200Ω as opposed to the intended 100Ω. It is recommended to use external termination resistors for differential inputs. The on-chip termination resistors can be disabled through Lattice design software.
- Soft Error Detection logic may not produce the correct result when it is run for the first time after configuration. To use this feature, discard the result from the first operation. Subsequent operations will produce the correct result.
- Under certain conditions, I<sub>ILH</sub> exceeds data sheet specifications. The following table provides more details:

Condition	Clamp	Pad Rising I <sub>ILH</sub> Max.	Pad Falling I <sub>ILH</sub> Min.	Steady State Pad High I <sub>ILH</sub>	Steady State Pad Low I <sub>ILH</sub>
VPAD > VCCIO	OFF	1 mA	-1 mA	1 mA	10 μA
VPAD = VCCIO	ON	10 μA	-10 μA	10 μA	10 μA
VPAD = VCCIO	OFF	1 mA	-1 mA	1 mA	10 μA
VPAD < VCCIO	OFF	10 μA	-10 μA	10 μA	10 μA

- The user SPI interface does not operate correctly in some situations. During master read access and slave write access, the last byte received does not generate the RRDY interrupt.
- In GDDRX2, GDDRX4 and GDDR71 modes, ECLKSYNC may have a glitch in the output under certain conditions, leading to possible loss of synchronization.
- When using the hard I<sup>2</sup>C IP core, the I<sup>2</sup>C status registers I<sub>2</sub>C\_1\_SR and I<sub>2</sub>C\_2\_SR may not update correctly.
- PLL Lock signal will glitch high when coming out of standby. This glitch lasts for about 10 μsec before returning low.
- Dual boot only available on HC devices, requires tying VCC and VCCIO2 to the same 3.3 V or 2.5 V supply.
