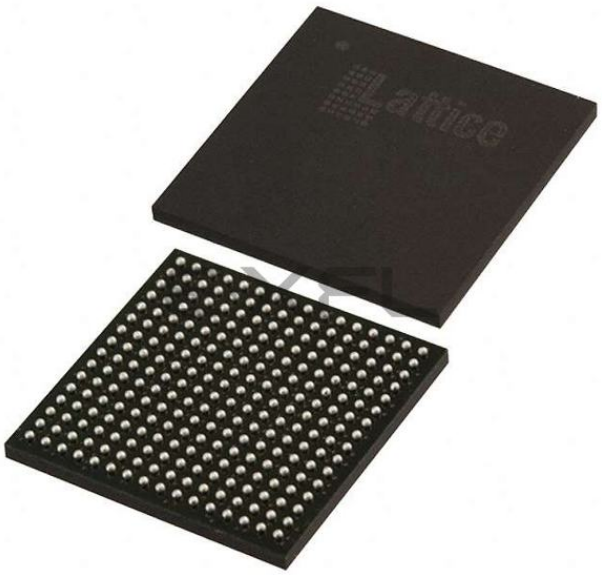
Lattice Semiconductor Corporation - LCMXO2-2000HC-4FTG256C Datasheet



Welcome to E-XFL.COM

Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Details	
Product Status	Active
Number of LABs/CLBs	264
Number of Logic Elements/Cells	2112
Total RAM Bits	75776
Number of I/O	206
Number of Gates	-
Voltage - Supply	2.375V ~ 3.465V
Mounting Type	Surface Mount
Operating Temperature	0°C ~ 85°C (TJ)
Package / Case	256-LBGA
Supplier Device Package	256-FTBGA (17x17)
Purchase URL	https://www.e-xfl.com/product-detail/lattice-semiconductor/lcmxo2-2000hc-4ftg256c

Modes of Operation

Each slice has up to four potential modes of operation: Logic, Ripple, RAM and ROM.

Logic Mode
In this mode, the LUTs in each slice are configured as 4-input combinatorial lookup tables. A LUT4 can have 16 possible input combinations. Any four input logic functions can be generated by programming this lookup table. Since there are two LUT4s per slice, a LUT5 can be constructed within one slice. Larger look-up tables such as LUT6, LUT7 and LUT8 can be constructed by concatenating other slices. Note LUT8 requires more than four slices.

Ripple Mode
Ripple mode supports the efficient implementation of small arithmetic functions. In Ripple mode, the following functions can be implemented by each slice:

- Addition 2-bit
- Subtraction 2-bit
- Add/subtract 2-bit using dynamic control
- Up counter 2-bit
- Down counter 2-bit
- Up/down counter with asynchronous clear
- Up/down counter with preload (sync)
- Ripple mode multiplier building block
- Multiplier support
- Comparator functions of A and B inputs
  — A greater-than-or-equal-to B
  — A not-equal-to B
  — A less-than-or-equal-to B

Ripple mode includes an optional configuration that performs arithmetic using fast carry chain methods. In this configuration (also referred to as CCU2 mode) two additional signals, Carry Generate and Carry Propagate, are generated on a per-slice basis to allow fast arithmetic functions to be constructed by concatenating slices.

RAM Mode

In this mode, a 16x4-bit distributed single port RAM (SPR) can be constructed by using each LUT block in Slice 0 and Slice 1 as a 16x1-bit memory. Slice 2 is used to provide memory address and control signals.

MachXO2 devices support distributed memory initialization.

The Lattice design tools support the creation of a variety of different size memories. Where appropriate, the software will construct these using distributed memory primitives that represent the capabilities of the PFU. Table 2-3 shows the number of slices required to implement different distributed RAM primitives. For more information about using RAM in MachXO2 devices, please see TN1201, Memory Usage Guide for MachXO2 Devices.

Table 2-3. Number of Slices Required For Implementing Distributed RAM

	SPR 16x4	PDPR 16x4
Number of slices	3	3

Note: SPR = Single Port RAM, PDPR = Pseudo Dual Port RAM

Programmable I/O Cells (PIC)

The programmable logic associated with an I/O is called a PIO. The individual PIO are connected to their respective sysIO buffers and pads. On the MachXO2 devices, the PIO cells are assembled into groups of four PIO cells called a Programmable I/O Cell or PIC. The PICs are placed on all four sides of the device.

On all the MachXO2 devices, two adjacent PIOs can be combined to provide a complementary output driver pair.

The MachXO2-640U, MachXO2-1200/U and higher density devices contain enhanced I/O capability. All PIO pairs on these larger devices can implement differential receivers. Half of the PIO pairs on the top edge of these devices can be configured as true LVDS transmit pairs. The PIO pairs on the bottom edge of these higher density devices have on-chip differential termination and also provide PCI support.

PIO

The PIO contains three blocks: an input register block, output register block and tri-state register block. These blocks contain registers for operating in a variety of modes along with the necessary clock and selection logic.

Table 2-8. PIO Signal List

Pin Name	I/O Type	Description
CE	Input	Clock Enable
D	Input	Pin input from sysIO buffer.
INDD	Output	Register bypassed input.
INCK	Output	Clock input
Q0	Output	DDR positive edge input
Q1	Output	Registered input/DDR negative edge input
D0	Input	Output signal from the core (SDR and DDR)
D1	Input	Output signal from the core (DDR)
TD	Input	Tri-state signal from the core
Q	Output	Data output signals to sysIO Buffer
TQ	Output	Tri-state output signals to sysIO Buffer
DQSR90[1]	Input	DQS shift 90-degree read clock
DQSW90[1]	Input	DQS shift 90-degree write clock
DDRCLKPOL[1]	Input	DDR input register polarity control signal from DQS
SCLK	Input	System clock for input and output/tri-state blocks.
RST	Input	Local set reset signal

1. Available in PIO on right edge only.

Input Register Block

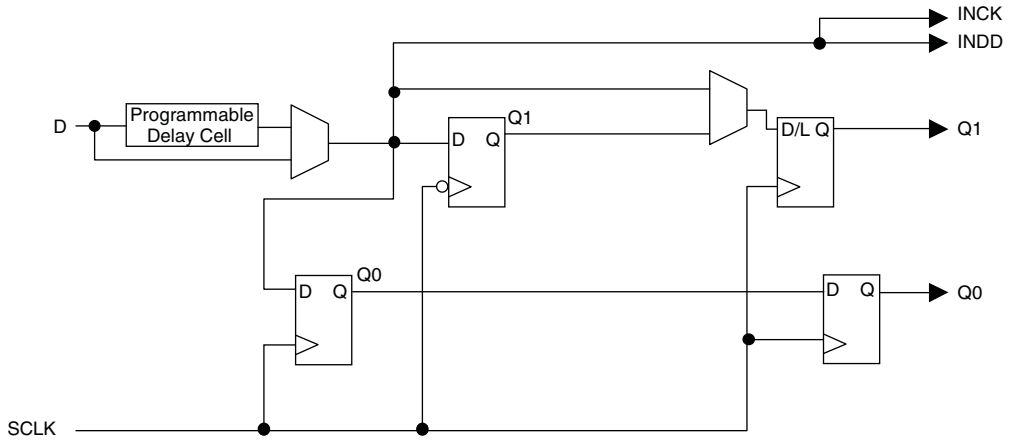
The input register blocks for the PIOs on all edges contain delay elements and registers that can be used to condition high-speed interface signals before they are passed to the device core. In addition to this functionality, the input register blocks for the PIOs on the right edge include built-in logic to interface to DDR memory.

Figure 2-12 shows the input register block for the PIOs located on the left, top and bottom edges. Figure 2-13 shows the input register block for the PIOs on the right edge.

Left, Top, Bottom Edges

Input signals are fed from the sysIO buffer to the input register block (as signal D). If desired, the input signal can bypass the register and delay elements and be used directly as a combinatorial signal (INDD), and a clock (INCK). If an input delay is desired, users can select a fixed delay. I/Os on the bottom edge also have a dynamic delay, DEL[4:0]. The delay, if selected, reduces input register hold time requirements when using a global clock. The input block allows two modes of operation. In single data rate (SDR) the data is registered with the system clock (SCLK) by one of the registers in the single data rate sync register block. In Generic DDR mode, two registers are used to sample the data on the positive and negative edges of the system clock (SCLK) signal, creating two data streams.

Figure 2-12. MachXO2 Input Register Block Diagram (PIO on Left, Top and Bottom Edges)



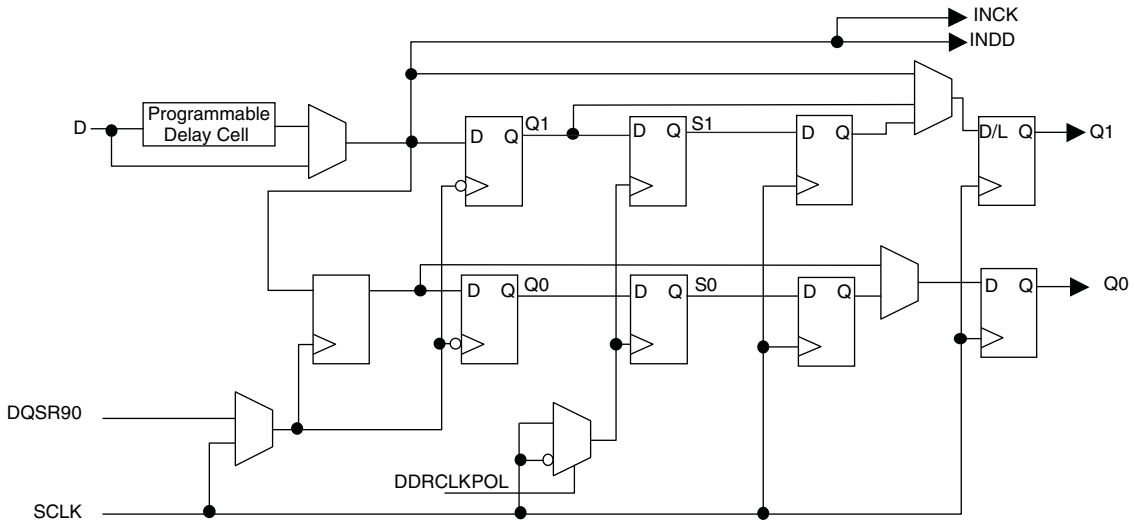
Right Edge

The input register block on the right edge is a superset of the same block on the top, bottom, and left edges. In addition to the modes described above, the input register block on the right edge also supports DDR memory mode.

In DDR memory mode, two registers are used to sample the data on the positive and negative edges of the modified DQS (DQSR90) in the DDR Memory mode creating two data streams. Before entering the core, these two data streams are synchronized to the system clock to generate two data streams.

The signal DDRCLKPOL controls the polarity of the clock used in the synchronization registers. It ensures adequate timing when data is transferred to the system clock domain from the DQS domain. The DQSR90 and DDRCLKPOL signals are generated in the DQS read-write block.

Figure 2-13. MachXO2 Input Register Block Diagram (PIO on Right Edge)



Output Register Block

The output register block registers signals from the core of the device before they are passed to the sysIO buffers.

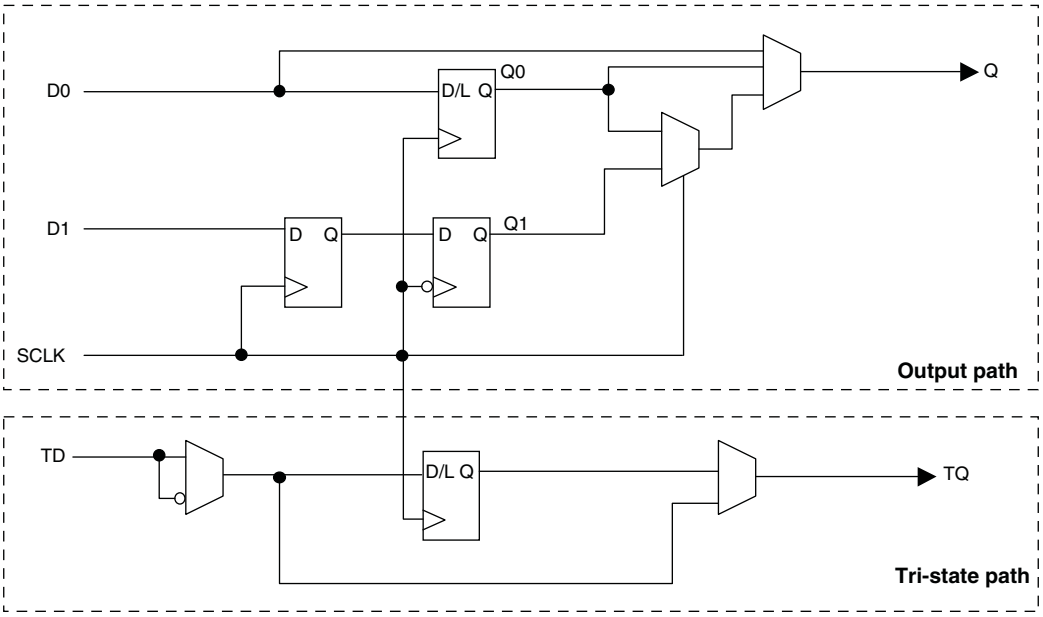
Left, Top, Bottom Edges

In SDR mode, D0 feeds one of the flip-flops that then feeds the output. The flip-flop can be configured as a D-type register or latch.

In DDR generic mode, D0 and D1 inputs are fed into registers on the positive edge of the clock. At the next falling edge the registered D1 input is registered into the register Q1. A multiplexer running off the same clock is used to switch the mux between the outputs of registers Q0 and Q1 that will then feed the output.

Figure 2-14 shows the output register block on the left, top and bottom edges.

Figure 2-14. MachXO2 Output Register Block Diagram (PIO on the Left, Top and Bottom Edges)



Right Edge

The output register block on the right edge is a superset of the output register on left, top and bottom edges of the device. In addition to supporting SDR and Generic DDR modes, the output register blocks for PIOs on the right edge include additional logic to support DDR-memory interfaces. Operation of this block is similar to that of the output register block on other edges.

In DDR memory mode, D0 and D1 inputs are fed into registers on the positive edge of the clock. At the next falling edge the registered D1 input is registered into the register Q1. A multiplexer running off the DQSW90 signal is used to switch the mux between the outputs of registers Q0 and Q1 that will then feed the output.

Figure 2-15 shows the output register block on the right edge.

1. Bottom banks of MachXO2-640U, MachXO2-1200/U and higher density devices only.
2. Reduced functionality. Refer to TN1202, MachXO2 sysIO Usage Guide for more detail.
3. These interfaces can be emulated with external resistors in all devices.

Static Supply Current – ZE Devices[1, 2, 3, 6]

Symbol	Parameter	Device	Typ.[4]	Units
I_{CC}	Core Power Supply	LCMXO2-256ZE	18	µA
		LCMXO2-640ZE	28	µA
		LCMXO2-1200ZE	56	µA
		LCMXO2-2000ZE	80	µA
		LCMXO2-4000ZE	124	µA
		LCMXO2-7000ZE	189	µA
I_{CCIO}	Bank Power Supply[5] V_{CCIO} = 2.5 V	All devices	1	µA

1. For further information on supply current, please refer to TN1198, Power Estimation and Management for MachXO2 Devices.
2. Assumes blank pattern with the following characteristics: all outputs are tri-stated, all inputs are configured as LVCMOS and held at V_{CCIO} or GND, on-chip oscillator is off, on-chip PLL is off. To estimate the impact of turning each of these items on, please refer to the following table or for more detail with your specific design use the Power Calculator tool.
3. Frequency = 0 MHz.
4. T_J = 25 °C, power supplies at nominal voltage.
5. Does not include pull-up/pull-down.
6. To determine the MachXO2 peak start-up current data, use the Power Calculator tool.

Static Power Consumption Contribution of Different Components – ZE Devices

The table below can be used for approximating static power consumption. For a more accurate power analysis for your design please use the Power Calculator tool.

Symbol	Parameter	Typ.	Units
I_{DCBG}	Bandgap DC power contribution	101	µA
I_{DCPOR}	POR DC power contribution	38	µA
$I_{DCIOBANKCONTROLLER}$	DC power contribution per I/O bank controller	143	µA

1. Lattice recommends soldering the central thermal pad onto the top PCB ground for improved thermal resistance.
2. For 48 QFN package, exposed die pad is the device ground.
3. 48-pin QFN information is 'Advanced'.

MachXO2 Family Data Sheet Ordering Information

MachXO2 Part Number Description

LCMXO2 – XXXX X X X – X XXXXXX X XX XX

Device Family
MachXO2 PLD

Logic Capacity
256 = 256 LUTs
640 = 640 LUTs
1200 = 1280 LUTs
2000 = 2112 LUTs
4000 = 4320 LUTs
7000 = 6864 LUTs

I/O Count
Blank = Standard Device
U = Ultra High I/O Device

Power/Performance
Z = Low Power
H = High Performance

Supply Voltage
C = 2.5 V / 3.3 V
E = 1.2 V

Speed
1 = Slowest
2
3 = Fastest
} Low Power

4 = Slowest
5
6 = Fastest
} High Performance

Device Status
Blank = Production Device
ES = Engineering Sample
R1 = Production Release 1 Device
1K = WLCSP Package, 1,000 parts per reel

Shipping Method
Blank = Trays
TR = Tape and Reel

Grade
C = Commercial
I = Industrial

Package
UWG25 = 25-Ball Halogen-Free WLCSP (0.4 mm Pitch)
SG32 = 32-Pin Halogen-Free QFN (0.5 mm Pitch)
SG48 = 48-Pin Halogen-Free QFN (0.5 mm Pitch)
UWG49 = 49-ball Halogen-Free WLCSP (0.4 mm Pitch)
UMG64 = 64-Ball Halogen-Free ucBGA (0.4 mm Pitch)
QN84 = 84-Pin Halogen-Free QFN (0.5 mm Pitch)
TG100 = 100-Pin Halogen-Free TQFP
TG144 = 144-Pin Halogen-Free TQFP
MG132 = 132-Ball Halogen-Free csBGA (0.5 mm Pitch)
MG184 = 184-Ball Halogen-Free csBGA (0.5 mm Pitch)
BG256 = 256-Ball Halogen-Free caBGA (0.8 mm Pitch)
FTG256 = 256-Ball Halogen-Free ftBGA (1.0 mm Pitch)
BG332 = 332-Ball Halogen-Free caBGA (0.8 mm Pitch)
FG484 = 484-Ball Halogen-Free fpBGA (1.0 mm Pitch)

* 48-pin QFN information is 'Advanced'.

1. This part number has a tape and reel quantity of 5,000 units with a minimum order quantity of 10,000 units. Order quantities must be in increments of 5,000 units. For example, a 10,000 unit order will be shipped in two reels with one reel containing 5,000 units and the other reel with less than 5,000 units (depending on test yields). Unserviced backlog will be canceled.
2. This part number has a tape and reel quantity of 1,000 units with a minimum order quantity of 1,000. Order quantities must be in increments of 1,000 units. For example, a 5,000 unit order will be shipped as 5 reels of 1000 units each.
3. This part number has a tape and reel quantity of 50 units with a minimum order quantity of 50. Order quantities must be in increments of 50 units. For example, a 1,000 unit order will be shipped as 20 reels of 50 units each.

MachXO2 Family Data Sheet Revision History

March 2017 **Data Sheet DS1035**

Date	Version	Section	Change Summary
March 2017	3.3	DC and Switching Characteristics	Updated the Absolute Maximum Ratings section. Added standards.
			Updated the sysIO Recommended Operating Conditions section. Added standards.
			Updated the sysIO Single-Ended DC Electrical Characteristics section. Added standards.
			Updated the MachXO2 External Switching Characteristics – HC/HE Devices section. Under 7:1 LVDS Outputs – GDDR71_TX.ECLK.7:1, the D_{VB} and the D_{VA} parameters were changed to D_{IB} and D_{IA}. The parameter descriptions were also modified.
			Updated the MachXO2 External Switching Characteristics – ZE Devices section. Under 7:1 LVDS Outputs – GDDR71_TX.ECLK.7:1, the D_{VB} and the D_{VA} parameters were changed to D_{IB} and D_{IA}. The parameter descriptions were also modified.
			Updated the sysCONFIG Port Timing Specifications section. Corrected the t_{INITL} units from ns to µs.
		Pinout Information	Updated the Signal Descriptions section. Revised the descriptions of the PROGRAMN, INITN, and DONE signals.
			Updated the Pinout Information Summary section. Added footnote to MachXO2-1200 32 QFN.
		Ordering Information	Updated the MachXO2 Part Number Description section. Corrected the MG184, BG256, FTG256 package information. Added “(0.8 mm Pitch)” to BG332.
			Updated the Ultra Low Power Industrial Grade Devices, Halogen Free (RoHS) Packaging section. — Updated LCMXO2-1200ZE-1UWG25ITR50 footnote. — Corrected footnote numbering typo. — Added the LCMXO2-2000ZE-1UWG49ITR50 and LCMXO2-2000ZE-1UWG49ITR1K part numbers. Updated/added footnote/s.

Date	Version	Section	Change Summary
May 2014	2.5	Architecture	Updated TransFR (Transparent Field Reconfiguration) section. Updated TransFR description for PLL use during background Flash programming.
February 2014	02.4	Introduction	Included the 49 WLCSP package in the MachXO2 Family Selection Guide table.
		Architecture	Added information to Standby Mode and Power Saving Options section.
		Pinout Information	Added the XO2-2000 49 WLCSP in the Pinout Information Summary table.
		Ordering Information	Added UW49 package in MachXO2 Part Number Description.
			Added and LCMXO2-2000ZE-1UWG49CTR in Ultra Low Power Commercial Grade Devices, Halogen Free (RoHS) Packaging section.
			Added and LCMXO2-2000ZE-1UWG49ITR in Ultra Low Power Industrial Grade Devices, Halogen Free (RoHS) Packaging section.
December 2013	02.3	Architecture	Updated information on CLKOS output divider in sysCLOCK Phase Locked Loops (PLLs) section.
		DC and Switching Characteristics	Updated Static Supply Current – ZE Devices table.
			Updated footnote 4 in sysIO Single-Ended DC Electrical Characteristics table; Updated V_{IL} Max. (V) data for LVCMOS 25 and LVCMOS 28.
			Updated V_{OS} test condition in sysIO Differential Electrical Characteristics - LVDS table.
September 2013	02.2	Architecture	Removed I^2C Clock-Stretching feature per PCN #10A-13.
			Removed information on PDPR memory in RAM Mode section.
			Updated Supported Input Standards table.
		DC and Switching Characteristics	Updated Power-On-Reset Voltage Levels table.
June 2013	02.1	Architecture	Architecture Overview – Added information on the state of the register on power up and after configuration.
			sysCLOCK Phase Locked Loops (PLLs) section – Added missing cross reference to sysCLOCK PLL Timing table.
		DC and Switching Characteristics	Added slew rate information to footnote 2 of the MachXO2 External Switching Characteristics – HC/HE Devices and the MachXO2 External Switching Characteristics – ZE Devices tables.
			Power-On-Reset Voltage Levels table – Added symbols.
