Understanding **Embedded - FPGAs (Field Programmable Gate Array)**

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications,

Details	
Product Status	Active
Number of LABs/CLBs	264
Number of Logic Elements/Cells	2112
Total RAM Bits	75776
Number of I/O	104
Number of Gates	-
Voltage - Supply	1.14V ~ 1.26V
Mounting Type	Surface Mount
Operating Temperature	0°C ~ 85°C (TJ)
Package / Case	132-LFBGA, CSPBGA
Supplier Device Package	132-CSPBGA (8x8)
Purchase URL	https://www.e-xfl.com/product-detail/lattice-semiconductor/lcmxo2-2000he-5mg132c

MachXO2 Family Data Sheet
Introduction

Features

■ **Flexible Logic Architecture**
  • Six devices with 256 to 6864 LUT4s and 18 to 334 I/Os

■ **Ultra Low Power Devices**
  • Advanced 65 nm low power process
  • As low as 22 µW standby power
  • Programmable low swing differential I/Os
  • Stand-by mode and other power saving options

■ **Embedded and Distributed Memory**
  • Up to 240 kbits sysMEM™ Embedded Block RAM
  • Up to 54 kbits Distributed RAM
  • Dedicated FIFO control logic

■ **On-Chip User Flash Memory**
  • Up to 256 kbits of User Flash Memory
  • 100,000 write cycles
  • Accessible through WISHBONE, SPI, I^{2}C and JTAG interfaces
  • Can be used as soft processor PROM or as Flash memory

■ **Pre-Engineered Source Synchronous I/O**
  • DDR registers in I/O cells
  • Dedicated gearing logic
  • 7:1 Gearing for Display I/Os
  • Generic DDR, DDRX2, DDRX4
  • Dedicated DDR/DDR2/LPDDR memory with DQS support

■ **High Performance, Flexible I/O Buffer**
  • Programmable sysIO™ buffer supports wide range of interfaces:
    – LVCMOS 3.3/2.5/1.8/1.5/1.2
    – LVTTL
    – PCI
    – LVDS, Bus-LVDS, MLVDS, RSDS, LVPECL
    – SSTL 25/18
    – HSTL 18
    – Schmitt trigger inputs, up to 0.5 V hysteresis
  • I/Os support hot socketing
  • On-chip differential termination
  • Programmable pull-up or pull-down mode

■ **Flexible On-Chip Clocking**
  • Eight primary clocks
  • Up to two edge clocks for high-speed I/O interfaces (top and bottom sides only)
  • Up to two analog PLLs per device with fractional-n frequency synthesis
    – Wide input frequency range (7 MHz to 400 MHz)

■ **Non-volatile, Infinitely Reconfigurable**
  • Instant-on – powers up in microseconds
  • Single-chip, secure solution
  • Programmable through JTAG, SPI or I^{2}C
  • Supports background programming of non-volatile memory
  • Optional dual boot with external SPI memory

■ **TransFR™ Reconfiguration**
 • In-field logic update while system operates

■ **Enhanced System Level Support**
  • On-chip hardened functions: SPI, I^{2}C, timer/counter
  • On-chip oscillator with 5.5% accuracy
  • Unique TraceID for system tracking
  • One Time Programmable (OTP) mode
  • Single power supply with extended operating range
  • IEEE Standard 1149.1 boundary scan
  • IEEE 1532 compliant in-system programming

■ **Broad Range of Package Options**
  • TQFP, WLCSP, ucBGA, csBGA, caBGA, ftBGA, fpBGA, QFN package options
  • Small footprint package options
    – As small as 2.5 mm x 2.5 mm
  • Density migration supported
  • Advanced halogen-free packaging

Figure 2-3. PFU Block Diagram
Slices

Slices 0-3 contain two LUT4s feeding two registers. Slices 0-2 can be configured as distributed memory. Table 2-1 shows the capability of the slices in PFU blocks along with the operation modes they enable. In addition, each PFU contains logic that allows the LUTs to be combined to perform functions such as LUT5, LUT6, LUT7 and LUT8. The control logic performs set/reset functions (programmable as synchronous/ asynchronous), clock select, chip-select and wider RAM/ROM functions.

Table 2-1. Resources and Modes Available per Slice

Slice	PFU Block	
	Resources	Modes
Slice 0	2 LUT4s and 2 Registers	Logic, Ripple, RAM, ROM
Slice 1	2 LUT4s and 2 Registers	Logic, Ripple, RAM, ROM
Slice 2	2 LUT4s and 2 Registers	Logic, Ripple, RAM, ROM
Slice 3	2 LUT4s and 2 Registers	Logic, Ripple, ROM

Figure 2-4 shows an overview of the internal logic of the slice. The registers in the slice can be configured for positive/negative and edge triggered or level sensitive clocks. All slices have 15 inputs from routing and one from the carry-chain (from the adjacent slice or PFU). There are seven outputs: six for routing and one to carry-chain (to the adjacent PFU). Table 2-2 lists the signals associated with Slices 0-3.

ROM Mode

ROM mode uses the LUT logic; hence, slices 0-3 can be used in ROM mode. Preloading is accomplished through the programming interface during PFU configuration.

For more information on the RAM and ROM modes, please refer to TN1201, Memory Usage Guide for MachXO2 Devices.

Routing

There are many resources provided in the MachXO2 devices to route signals individually or as buses with related control signals. The routing resources consist of switching circuitry, buffers and metal interconnect (routing) segments.

The inter-PFU connections are made with three different types of routing resources: x1 (spans two PFUs), x2 (spans three PFUs) and x6 (spans seven PFUs). The x1, x2, and x6 connections provide fast and efficient connections in the horizontal and vertical directions.

The design tools take the output of the synthesis tool and places and routes the design. Generally, the place and route tool is completely automatic, although an interactive routing editor is available to optimize the design.

Clock/Control Distribution Network

Each MachXO2 device has eight clock inputs (PCLK [T, C] [Banknum]_[2..0]) – three pins on the left side, two pins each on the bottom and top sides and one pin on the right side. These clock inputs drive the clock nets. These eight inputs can be differential or single-ended and may be used as general purpose I/O if they are not used to drive the clock nets. When using a single ended clock input, only the PCLKT input can drive the clock tree directly.

The MachXO2 architecture has three types of clocking resources: edge clocks, primary clocks and secondary high fanout nets. MachXO2-640U, MachXO2-1200/U and higher density devices have two edge clocks each on the top and bottom edges. Lower density devices have no edge clocks. Edge clocks are used to clock I/O registers and have low injection time and skew. Edge clock inputs are from PLL outputs, primary clock pads, edge clock bridge outputs and CIB sources.

The eight primary clock lines in the primary clock network drive throughout the entire device and can provide clocks for all resources within the device including PFUs, EBRs and PICs. In addition to the primary clock signals, MachXO2 devices also have eight secondary high fanout signals which can be used for global control signals, such as clock enables, synchronous or asynchronous clears, presets, output enables, etc. Internal logic can drive the global clock network for internally-generated global clocks and control signals.

The maximum frequency for the primary clock network is shown in the MachXO2 External Switching Characteristics table.

The primary clock signals for the MachXO2-256 and MachXO2-640 are generated from eight 17:1 muxes The available clock sources include eight I/O sources and 9 routing inputs. Primary clock signals for the MachXO2-640U, MachXO2-1200/U and larger devices are generated from eight 27:1 muxes The available clock sources include eight I/O sources, 11 routing inputs, eight clock divider inputs and up to eight sysCLOCK PLL outputs.

PIO

The PIO contains three blocks: an input register block, output register block and tri-state register block. These blocks contain registers for operating in a variety of modes along with the necessary clock and selection logic.

Table 2-8. PIO Signal List

Pin Name	I/O Type	Description
CE	Input	Clock Enable
D	Input	Pin input from sysIO buffer.
INDD	Output	Register bypassed input.
INCK	Output	Clock input
Q0	Output	DDR positive edge input
Q1	Output	Registered input/DDR negative edge input
D0	Input	Output signal from the core (SDR and DDR)
D1	Input	Output signal from the core (DDR)
TD	Input	Tri-state signal from the core
Q	Output	Data output signals to sysIO Buffer
TQ	Output	Tri-state output signals to sysIO Buffer
DQSR90[1]	Input	DQS shift 90-degree read clock
DQSW90[1]	Input	DQS shift 90-degree write clock
DDRCLKPOL[1]	Input	DDR input register polarity control signal from DQS
SCLK	Input	System clock for input and output/tri-state blocks.
RST	Input	Local set reset signal

1. Available in PIO on right edge only.

Input Register Block

The input register blocks for the PIOs on all edges contain delay elements and registers that can be used to condition high-speed interface signals before they are passed to the device core. In addition to this functionality, the input register blocks for the PIOs on the right edge include built-in logic to interface to DDR memory.

Figure 2-12 shows the input register block for the PIOs located on the left, top and bottom edges. Figure 2-13 shows the input register block for the PIOs on the right edge.

Left, Top, Bottom Edges
Input signals are fed from the sysIO buffer to the input register block (as signal D). If desired, the input signal can bypass the register and delay elements and be used directly as a combinatorial signal (INDD), and a clock (INCK). If an input delay is desired, users can select a fixed delay. I/Os on the bottom edge also have a dynamic delay, DEL[4:0]. The delay, if selected, reduces input register hold time requirements when using a global clock. The input block allows two modes of operation. In single data rate (SDR) the data is registered with the system clock (SCLK) by one of the registers in the single data rate sync register block. In Generic DDR mode, two registers are used to sample the data on the positive and negative edges of the system clock (SCLK) signal, creating two data streams.

Figure 2-20. Embedded Function Block Interface
Hardened I^{2}C IP Core

Every MachXO2 device contains two I^{2}C IP cores. These are the primary and secondary I^{2}C IP cores. Either of the two cores can be configured either as an I^{2}C master or as an I^{2}C slave. The only difference between the two IP cores is that the primary core has pre-assigned I/O pins whereas users can assign I/O pins for the secondary core.

When the IP core is configured as a master it will be able to control other devices on the I^{2}C bus through the interface. When the core is configured as the slave, the device will be able to provide I/O expansion to an I^{2}C Master. The I^{2}C cores support the following functionality:

• Master and Slave operation

• 7-bit and 10-bit addressing

• Multi-master arbitration support

• Up to 400 kHz data transfer speed

• General call support

• Interface to custom logic through 8-bit WISHBONE interface

There are some limitations on the use of the hardened user SPI. These are defined in the following technical notes:

- TN1087, Minimizing System Interruption During Configuration Using TransFR Technology (Appendix B)
- TN1205, Using User Flash Memory and Hardened Control Functions in MachXO2 Devices

Figure 2-22. SPI Core Block Diagram
Table 2-16 describes the signals interfacing with the SPI cores.

Table 2-16. SPI Core Signal Description

Signal Name	I/O	Master/Slave	Description
spi_csn[0]	O	Master	SPI master chip-select output
spi_csn[1..7]	O	Master	Additional SPI chip-select outputs (total up to eight slaves)
spi_scsn	I	Slave	SPI slave chip-select input
spi_irq	O	Master/Slave	Interrupt request
spi_clk	I/O	Master/Slave	SPI clock. Output in master mode. Input in slave mode.
spi_miso	I/O	Master/Slave	SPI data. Input in master mode. Output in slave mode.
spi_mosi	I/O	Master/Slave	SPI data. Output in master mode. Input in slave mode.
ufm_sn	I	Slave	Configuration Slave Chip Select (active low), dedicated for selecting the User Flash Memory (UFM).
cfg_stdby	O	Master/Slave	Stand-by signal – To be connected only to the power module of the MachXO2 device. The signal is enabled only if the "Wakeup Enable" feature has been set within the EFB GUI, SPI Tab.
cfg_wake	O	Master/Slave	Wake-up signal – To be connected only to the power module of the MachXO2 device. The signal is enabled only if the "Wakeup Enable" feature has been set within the EFB GUI, SPI Tab.

Programming and Erase Flash Supply Current – ZE Devices[1, 2, 3, 4]

Symbol	Parameter	Device	Typ.[5]	Units
I_{CC}	Core Power Supply	LCMXO2-256ZE	13	mA
		LCMXO2-640ZE	14	mA
		LCMXO2-1200ZE	15	mA
		LCMXO2-2000ZE	17	mA
		LCMXO2-4000ZE	18	mA
		LCMXO2-7000ZE	20	mA
I_{CCIO}	Bank Power Supply[6]	All devices	0	mA

1. For further information on supply current, please refer to TN1198, Power Estimation and Management for MachXO2 Devices.
2. Assumes all inputs are held at V_{CCIO} or GND and all outputs are tri-stated.
3. Typical user pattern.
4. JTAG programming is at 25 MHz.
5. TJ = 25 °C, power supplies at nominal voltage.
6. Per bank. V_{CCIO} = 2.5 V. Does not include pull-up/pull-down.

sysIO Recommended Operating Conditions

1. Inputs on-chip. Outputs are implemented with the addition of external resistors.
2. MachXO2-640U, MachXO2-1200/U and larger devices have dedicated LVDS buffers.
3. Input on the bottom bank of the MachXO2-640U, MachXO2-1200/U and larger devices only.
4. Supported only for inputs and BIDIs for all ZE devices, and –6 speed grade for HE and HC devices.

BLVDS

The MachXO2 family supports the BLVDS standard through emulation. The output is emulated using complementary LVCMOS outputs in conjunction with resistors across the driver outputs. The input standard is supported by the LVDS differential input buffer. BLVDS is intended for use when multi-drop and bi-directional multi-point differential signaling is required. The scheme shown in Figure 3-2 is one possible solution for bi-directional multi-point differential signals.

Figure 3-2. BLVDS Multi-point Output Example
Table 3-2. BLVDS DC Conditions[1]

Over Recommended Operating Conditions

Symbol	Description	Nominal		Units
		Zo = 45	Zo = 90	
Z_{OUT}	Output impedance	20	20	Ohms
R_S	Driver series resistance	80	80	Ohms
R_{TLEFT}	Left end termination	45	90	Ohms
R_{TRIGHT}	Right end termination	45	90	Ohms
V_{OH}	Output high voltage	1.376	1.480	V
V_{OL}	Output low voltage	1.124	1.020	V
V_{OD}	Output differential voltage	0.253	0.459	V
V_{CM}	Output common mode voltage	1.250	1.250	V
I_{DC}	DC output current	11.236	10.204	mA

Parameter	Description	Device	−6 Min.	−6 Max.	−5 Min.	−5 Max.	−4 Min.	−4 Max.	Units
Generic DDRX2 Outputs with Clock and Data Centered at Pin Using PCLK Pin for Clock Input – GDDRX2_TX.ECLK.Centered[9, 12]									
t_{DVB}	Output Data Valid Before CLK Output	MachXO2-640U, MachXO2-1200/U and larger devices, top side only.	0.535	—	0.670	—	0.830	—	ns
t_{DVA}	Output Data Valid After CLK Output		0.535	—	0.670	—	0.830	—	ns
f_{DATA}	DDRX2 Serial Output Data Speed		—	664	—	554	—	462	Mbps
f_{DDRX2}	DDRX2 ECLK Frequency (minimum limited by PLL)		—	332	—	277	—	231	MHz
f_{SCLK}	SCLK Frequency		—	166	—	139	—	116	MHz
Generic DDRX4 Outputs with Clock and Data Aligned at Pin Using PCLK Pin for Clock Input – GDDRX4_TX.ECLK.Aligned[9, 12]									
t_{DIA}	Output Data Invalid After CLK Output	MachXO2-640U, MachXO2-1200/U and larger devices, top side only.	—	0.200	—	0.215	—	0.230	ns
t_{DIB}	Output Data Invalid Before CLK Output		—	0.200	—	0.215	—	0.230	ns
f_{DATA}	DDRX4 Serial Output Data Speed		—	756	—	630	—	524	Mbps
f_{DDRX4}	DDRX4 ECLK Frequency		—	378	—	315	—	262	MHz
f_{SCLK}	SCLK Frequency		—	95	—	79	—	66	MHz
Generic DDRX4 Outputs with Clock and Data Centered at Pin Using PCLK Pin for Clock Input – GDDRX4_TX.ECLK.Centered[9, 12]									
t_{DVB}	Output Data Valid Before CLK Output	MachXO2-640U, MachXO2-1200/U and larger devices, top side only.	0.455	—	0.570	—	0.710	—	ns
t_{DVA}	Output Data Valid After CLK Output		0.455	—	0.570	—	0.710	—	ns
f_{DATA}	DDRX4 Serial Output Data Speed		—	756	—	630	—	524	Mbps
f_{DDRX4}	DDRX4 ECLK Frequency (minimum limited by PLL)		—	378	—	315	—	262	MHz
f_{SCLK}	SCLK Frequency		—	95	—	79	—	66	MHz
7:1 LVDS Outputs – GDDR71_TX.ECLK.7:1[9, 12]									
t_{DIB}	Output Data Invalid Before CLK Output	MachXO2-640U, MachXO2-1200/U and larger devices, top side only.	—	0.160	—	0.180	—	0.200	ns
t_{DIA}	Output Data Invalid After CLK Output		—	0.160	—	0.180	—	0.200	ns
f_{DATA}	DDR71 Serial Output Data Speed		—	756	—	630	—	524	Mbps
f_{DDR71}	DDR71 ECLK Frequency		—	378	—	315	—	262	MHz
f_{CLKOUT}	7:1 Output Clock Frequency (SCLK) (minimum limited by PLL)		—	108	—	90	—	75	MHz

Signal Descriptions

Signal Name	I/O	Descriptions
General Purpose		
P[Edge] [Row/Column Number]_[A/B/C/D]	I/O	[Edge] indicates the edge of the device on which the pad is located. Valid edge designations are L (Left), B (Bottom), R (Right), T (Top).
		[Row/Column Number] indicates the PFU row or the column of the device on which the PIO Group exists. When Edge is T (Top) or (Bottom), only need to specify Row Number. When Edge is L (Left) or R (Right), only need to specify Column Number.
		[A/B/C/D] indicates the PIO within the group to which the pad is connected.
		Some of these user-programmable pins are shared with special function pins. When not used as special function pins, these pins can be programmed as I/Os for user logic.
		During configuration of the user-programmable I/Os, the user has an option to tri-state the I/Os and enable an internal pull-up, pull-down or buskeeper resistor. This option also applies to unused pins (or those not bonded to a package pin). The default during configuration is for user-programmable I/Os to be tri-stated with an internal pull-down resistor enabled. When the device is erased, I/Os will be tri-stated with an internal pull-down resistor enabled. Some pins, such as PROGRAMN and JTAG pins, default to tri-stated I/Os with pull-up resistors enabled when the device is erased.
NC	—	No connect.
GND	—	GND – Ground. Dedicated pins. It is recommended that all GNDs are tied together. For QFN 48 package, the exposed die pad is the device ground.
VCC	—	V_{CC} – The power supply pins for core logic. Dedicated pins. It is recommended that all VCCs are tied to the same supply.
VCCIOx	—	VCCIO – The power supply pins for I/O Bank x. Dedicated pins. It is recommended that all VCCIOs located in the same bank are tied to the same supply.
PLL and Clock Functions (Used as user-programmable I/O pins when not used for PLL or clock pins)		
[LOC]_GPLL[T, C]_IN	—	Reference Clock (PLL) input pads: [LOC] indicates location. Valid designations are L (Left PLL) and R (Right PLL). T = true and C = complement.
[LOC]_GPLL[T, C]_FB	—	Optional Feedback (PLL) input pads: [LOC] indicates location. Valid designations are L (Left PLL) and R (Right PLL). T = true and C = complement.
PCLK [n]_[2:0]	—	Primary Clock pads. One to three clock pads per side.
Test and Programming (Dual function pins used for test access port and during sysCONFIG™)		
TMS	I	Test Mode Select input pin, used to control the 1149.1 state machine.
TCK	I	Test Clock input pin, used to clock the 1149.1 state machine.
TDI	I	Test Data input pin, used to load data into the device using an 1149.1 state machine.
TDO	O	Output pin – Test Data output pin used to shift data out of the device using 1149.1.
JTAGENB	I	Optionally controls behavior of TDI, TDO, TMS, TCK. If the device is configured to use the JTAG pins (TDI, TDO, TMS, TCK) as general purpose I/O, then:
		If JTAGENB is low: TDI, TDO, TMS and TCK can function a general purpose I/O.
		If JTAGENB is high: TDI, TDO, TMS and TCK function as JTAG pins.
		For more details, refer to TN1204, MachXO2 Programming and Configuration Usage Guide.
Configuration (Dual function pins used during sysCONFIG)		
PROGRAMN	I	Initiates configuration sequence when asserted low. During configuration, or when reserved as PROGRAMN in user mode, this pin always has an active pull-up.

MachXO2 Part Number Description

LCMXO2 – XXXX X X X – X XXXXXX X XX XX

Device Family
MachXO2 PLD

Logic Capacity
256 = 256 LUTs
640 = 640 LUTs
1200 = 1280 LUTs
2000 = 2112 LUTs
4000 = 4320 LUTs
7000 = 6864 LUTs

I/O Count
Blank = Standard Device
U = Ultra High I/O Device

Power/Performance
Z = Low Power
H = High Performance

Supply Voltage
C = 2.5 V / 3.3 V
E = 1.2 V

Speed
1 = Slowest
2 }Low Power
3 = Fastest

4 = Slowest
5 }High Performance
6 = Fastest

Device Status
Blank = Production Device
ES = Engineering Sample
R1 = Production Release 1 Device
1K = WLCSP Package, 1,000 parts per reel

Shipping Method
Blank = Trays
TR = Tape and Reel

Grade
C = Commercial
I = Industrial

Package

UWG25	= 25-Ball Halogen-Free WLCSP (0.4 mm Pitch)
SG32	= 32-Pin Halogen-Free QFN (0.5 mm Pitch)
SG48	= 48-Pin Halogen-Free QFN (0.5 mm Pitch)
UWG49	= 49-ball Halogen-Free WLCSP (0.4 mm Pitch)
UMG64	= 64-Ball Halogen-Free ucBGA (0.4 mm Pitch)
QN84	= 84-Pin Halogen-Free QFN (0.5 mm Pitch)
TG100	= 100-Pin Halogen-Free TQFP
TG144	= 144-Pin Halogen-Free TQFP
MG132	= 132-Ball Halogen-Free csBGA (0.5 mm Pitch)
MG184	= 184-Ball Halogen-Free csBGA (0.5 mm Pitch)
BG256	= 256-Ball Halogen-Free caBGA (0.8 mm Pitch)
FTG256	= 256-Ball Halogen-Free ftBGA (1.0 mm Pitch)
BG332	= 332-Ball Halogen-Free caBGA (0.8 mm Pitch)
FG484	= 484-Ball Halogen-Free fpBGA (1.0 mm Pitch)

* 48-pin QFN information is 'Advanced'.

Date	Version	Section	Change Summary
May 2011	01.3	Multiple	Replaced "SED" with "SRAM CRC Error Detection" throughout the document.
		DC and Switching Characteristics	Added footnote 1 to Program Erase Specifications table.
		Pinout Information	Updated Pin Information Summary tables.
			Signal name SO/SISPISO changed to SO/SPISO in the Signal Descriptions table.
April 2011	01.2	—	Data sheet status changed from Advance to Preliminary.
		Introduction	Updated MachXO2 Family Selection Guide table.
		Architecture	Updated Supported Input Standards table.
			Updated sysMEM Memory Primitives diagram.
			Added differential SSTL and HSTL IO standards.
		DC and Switching Characteristics	Updates following parameters: POR voltage levels, DC electrical characteristics, static supply current for ZE/HE/HC devices, static power consumption contribution of different components – ZE devices, programming and erase Flash supply current.
			Added VREF specifications to sysIO recommended operating conditions.
			Updating timing information based on characterization.
			Added differential SSTL and HSTL IO standards.
		Ordering Information	Added Ordering Part Numbers for R1 devices, and devices in WLCSP packages.
			Added R1 device specifications.
January 2011	01.1	All	Included ultra-high I/O devices.
		DC and Switching Characteristics	Recommended Operating Conditions table – Added footnote 3.
			DC Electrical Characteristics table – Updated data for I_{IL}, I_{IH}. V_{HYST} typical values updated.
			Generic DDRX2 Outputs with Clock and Data Aligned at Pin (GDDRX2_TX.ECLK.Aligned) Using PCLK Pin for Clock Input tables – Updated data for T_{DIA} and T_{DIB}.
			Generic DDRX4 Outputs with Clock and Data Aligned at Pin (GDDRX4_TX.ECLK.Aligned) Using PCLK Pin for Clock Input tables – Updated data for T_{DIA} and T_{DIB}.
			Power-On-Reset Voltage Levels table - clarified note 3.
			Clarified VCCIO related recommended operating conditions specifications.
			Added power supply ramp rate requirements.
			Added Power Supply Ramp Rates table.
			Updated Programming/Erase Specifications table.
			Removed references to V_{CCP}.
		Pinout Information	Included number of 7:1 and 8:1 gearboxes (input and output) in the pin information summary tables.
			Removed references to V_{CCP}.
November 2010	01.0	—	Initial release.
